

Emerging Climate-Oriented Bioeconomy Frameworks - a Central Role for Forests

FCWG Learning Exchange Series, March 2022

The Nature Conservancy: Rachel Pasternack, Ethan Belair, & Yangyang Wang

Disclaimer and Request

- Phases 1-3 are published in *Sustainability* 2022, 14(3).
- Phase 4 is an ongoing project, with preliminary results.
- We're still actively designing this research, somewhat like building a plane as you fly.
- Please don't share details from Phase 4 without checking first.

Who We Are

Global, science-based environmental NGO

GLOBAL REACH & SCALE

Largest conservation not-for-profit in the world

PLACE-BASED EXPERIENCE

At work across 50 States and >70 countries

SCIENCE-BASED KNOW-HOW

Home to more than 600 scientists

NETWORK OF RELATIONSHIPS

Powered by 1,350 trustees and 1 million members

20+ Collaborating Organizations

OUR PRIORITIES:

- ▶ Address the urgent **climate** crisis
- ▶ Protect the health of the world's **lands, oceans** and **freshwater**

What Are Natural Climate Solutions?

How do we Sustainably Accelerate them?

What Is Mass Timber & Why is it Important?

Figure 2. Buildings and construction's share of global final energy and energy-related CO₂ emissions, 2020

Note: "Buildings construction industry" is the portion (estimated) of overall industry devoted to manufacturing building construction materials such as steel, cement and glass. Indirect emissions are emissions from power generation for electricity and commercial heat.

CLT DESIGN + CONSTRUCTION

A-cross the board.

What is CLT?

Cross-laminated timber (CLT) is a wood panel system that is rapidly gaining popularity in the U.S. after being widely adopted in Europe. The strength, dimensional stability, and rigidity of CLT allow it to be used in mid- and high-rise buildings.

Demand for Mass Timber Is Rising.... But what does that mean for Forests?

Global Cross Laminated Timber (CLT) Market Will Reach USD 1606 Million By 2024: Zion Market Research

According to the report, the global cross laminated timber (CLT) market was valued at USD 603 million in 2017 and is expected to reach USD 1606 million in 2024, growing at a CAGR of 15% between 2018 and 2024.

U.S. Mass Timber Projects by Year

As the chart illustrates, the number of projects initiated each year has grown rapidly, from fewer than 20 in 2014 to well over 200 (estimated) by the end of 2018.

WRITTEN BY
The Economist INTELLIGENCE UNIT

Mass timber, which uses prefabricated solid wood panels for low- to mid-rise construction applications, is already becoming popular in Europe and shows increasing commercial potential worldwide. Substituting mass timber for concrete and steel can reduce greenhouse gas emissions in construction without compromising quality, though the net effect of mass timber on the climate also depends on its land use impacts. Ongoing research into these impacts, along with emerging efforts to integrate forest restoration projects into mass timber supply chains, could ultimately shed light on the potential value of mass timber for carbon removal.

Biological sequestration

Substitution and storage carbon benefits can be 3x the biological benefits of growing trees⁴

Wood Innovations Overview & Progress to Date

Mass Timber, Massive Assumptions

- Common logic chain assumption, the **Environmentalist Edition**:
More mass timber → more demand for wood → more timber harvesting → more deforestation/degradation
- This seems overly harsh, we should investigate these assumptions

Mass Timber, Massive Assumptions

- Common logic chain assumption, the **Rose-colored Glasses Edition**:
Mass timber is composite → could use small, low-value trees → balances silviculture and \$ → healthier forests
- This seems overly optimistic, we should investigate these assumptions

+

5-Phased Wood Innovations Project

- Theoretical benefits to substituting mass timber for oil-intensive, non-renewable materials
- What actual benefits will result, given myriad impacts on markets, carbon stocks, etc?
- Can we realize a meta benefit of integrating our thinking across different fields of study?
 - Logistics/Production & Natural Climate Solutions

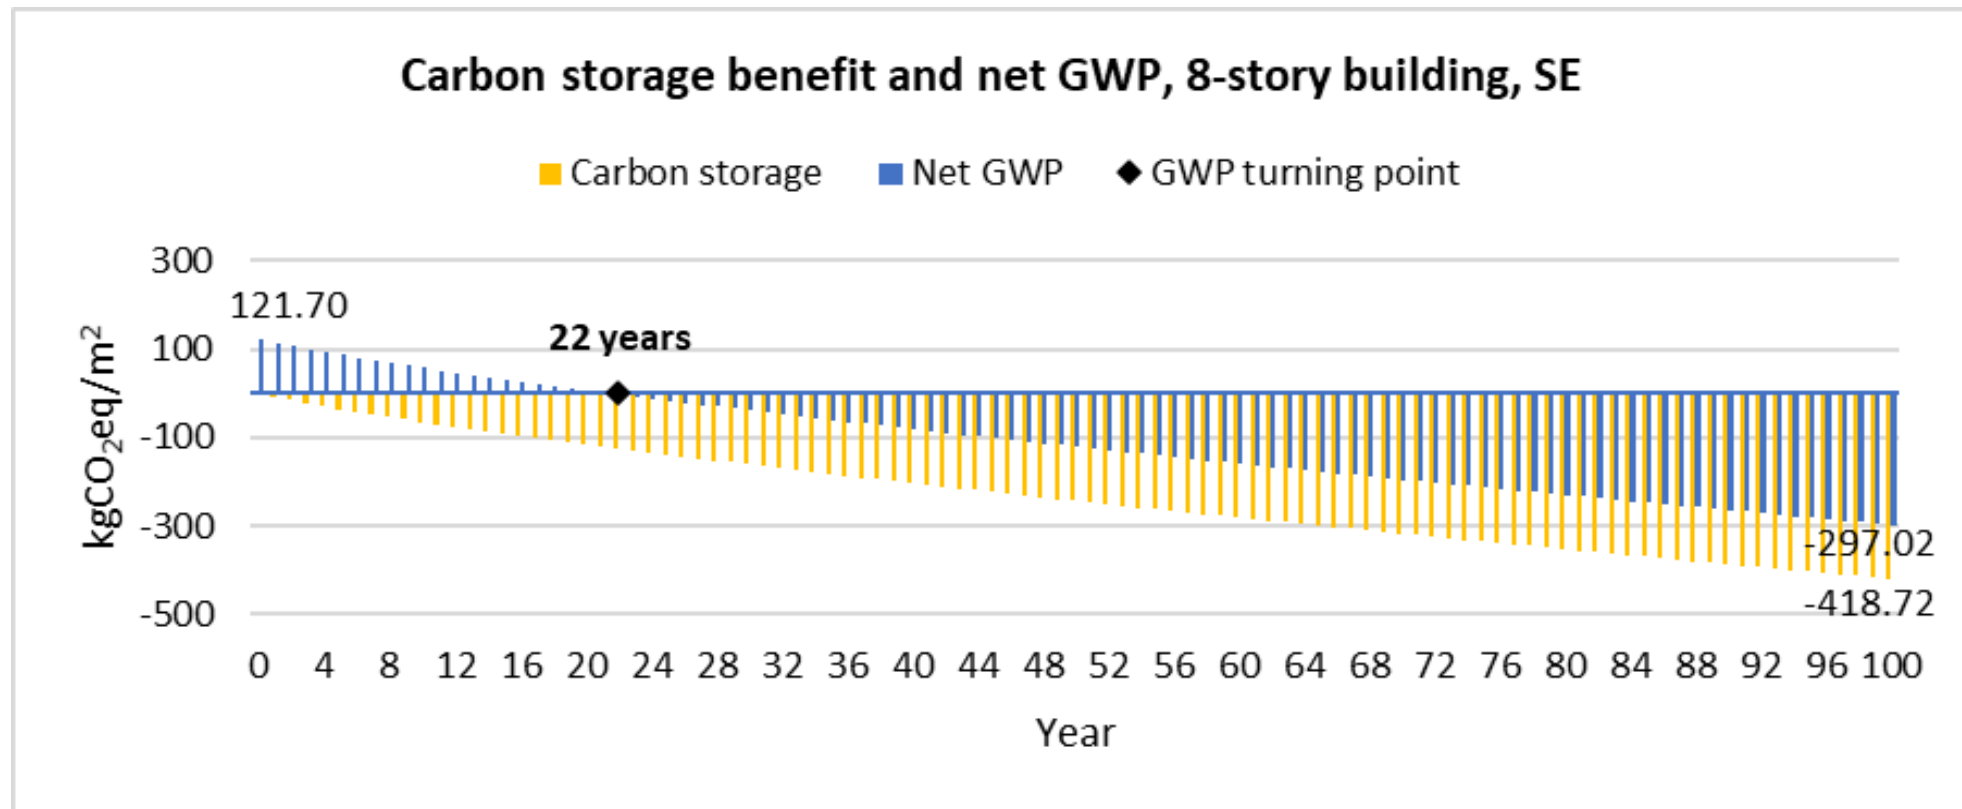

Phase 1: Whole Building LCA

- Wholistic comparison of emissions from extraction, processing, transport; longevity of carbon storage; energy sources; etc.
 - 3 pairs conventional, mass timber buildings
 - 8-, 12-, and 18-stories
 - Seattle, Boston, and Atlanta
 - 80-year lifespan, 100-year time horizon
- Results reaffirm potential for environmental benefits from mass timber, but benefits:
 - Not linear with building size
 - Vary by region
 - Increase with building lifespan

Phase 1: Whole Building LCA

Key lessons: minimize fossil GHG emissions, maximize biogenic carbon storage

Phase 2: Regional Demand Assessment

- Estimate future demand for mass timber based on:
 - Housing starts data, modeled forward
 - Mass timber utilization based on performance, cost, and availability
 - Innovation diffusion models, based on exposure and adoption trends for new tech
- Predict demand for specific mass timber products based on specific building designs and needs

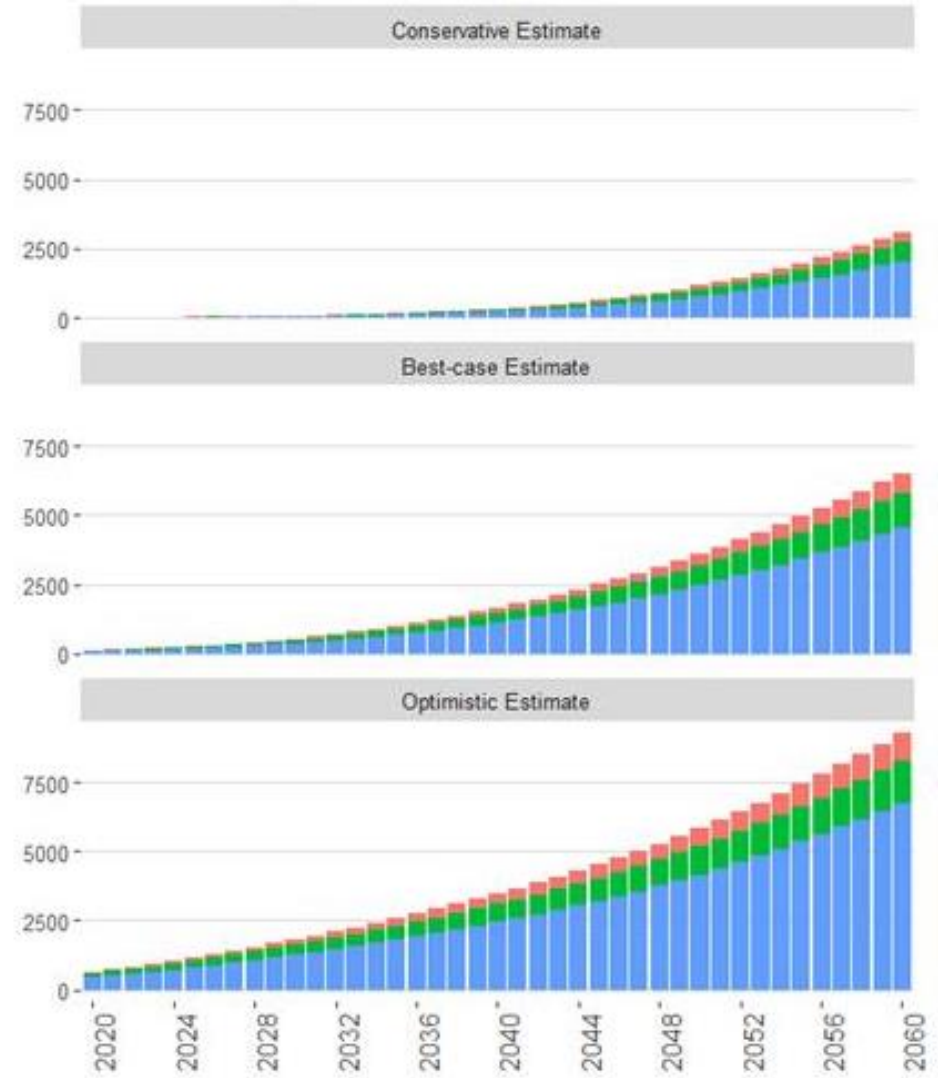

Mass Timber Adoption (1,000 m³)

USA

by Building Type

by Building Height

Type ■ Non-Residential ■ Residential

Height ■ 13 & higher ■ 7 to 12 ■ 6 & lower

China

Mass Timber Adoption (1,000 m³)

by Building Type

Type ■ Non-Residential ■ Residential

by Building Height

Height ■ 13 & higher ■ 7 to 12 ■ 6 & lower

Phase 2: Regional Demand Assessment

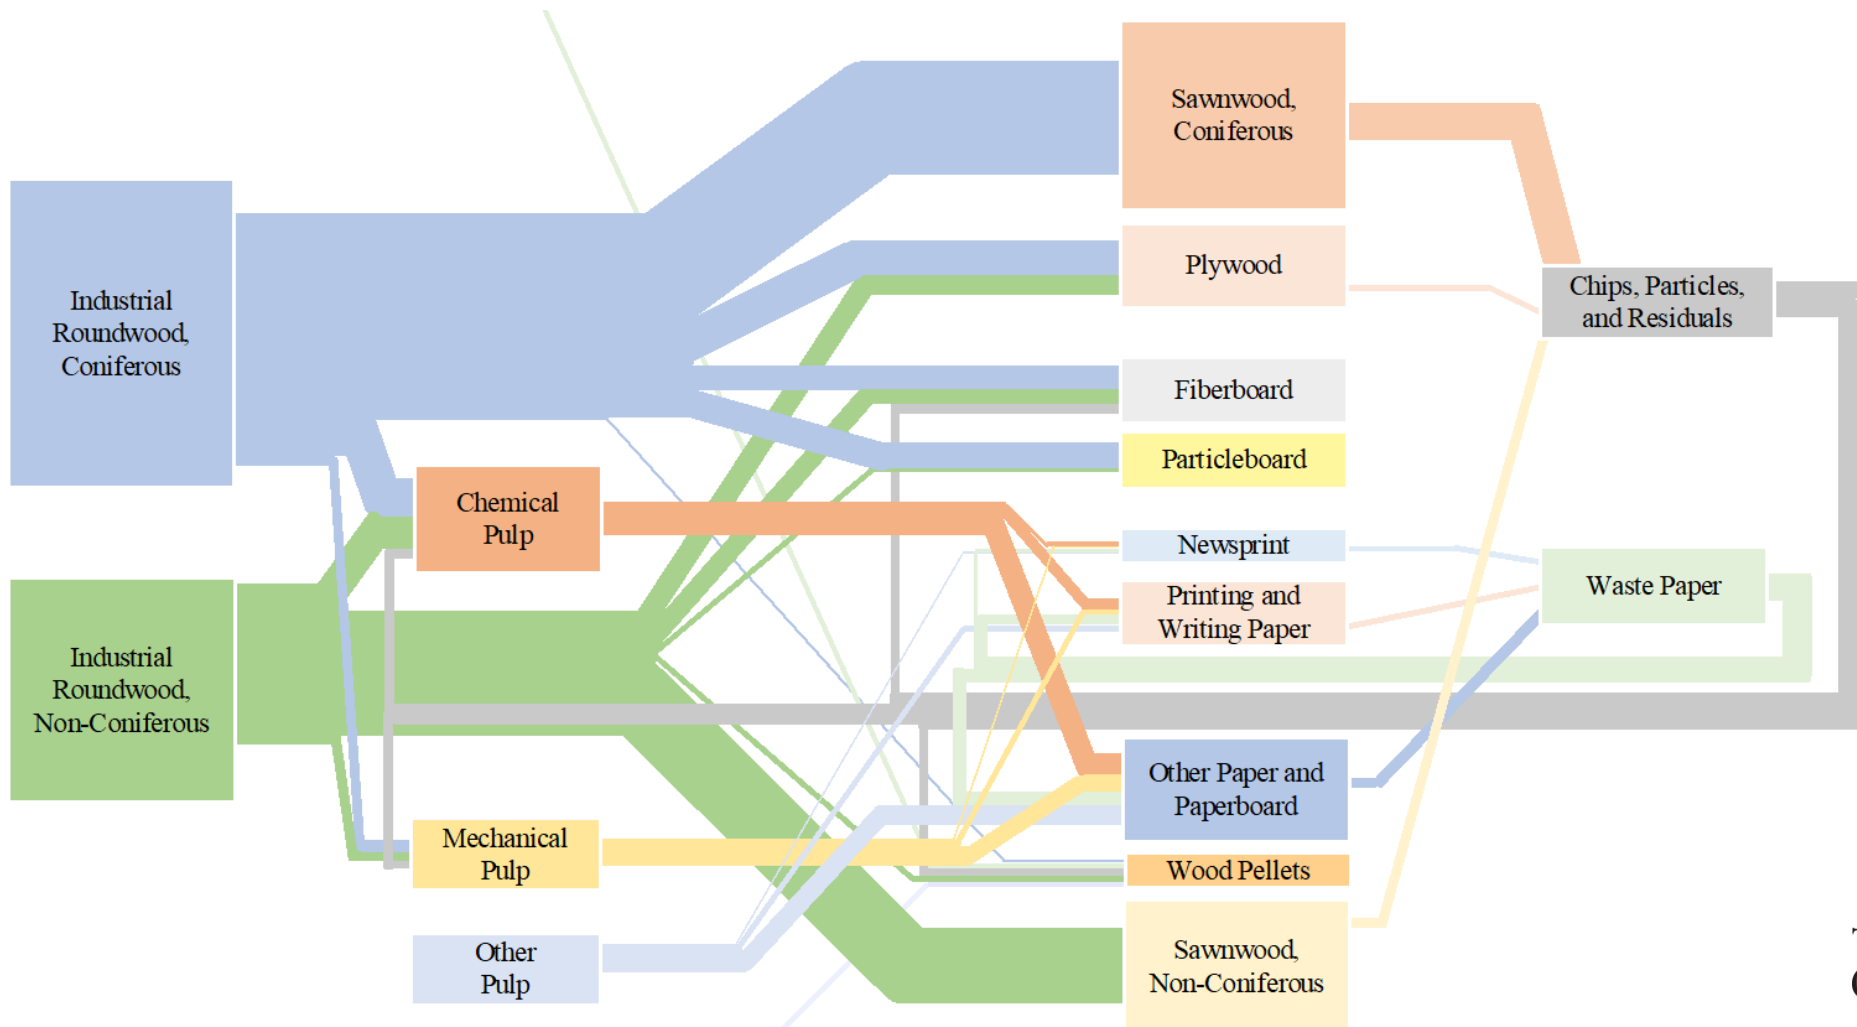

Key Lessons:

- Adoption varies by locale
 - Social, cultural, economic drivers
- Within region, adoption varies across building types
- Expected demand for mass timber in moderate to high adoption regions in the low millions of cubic meters

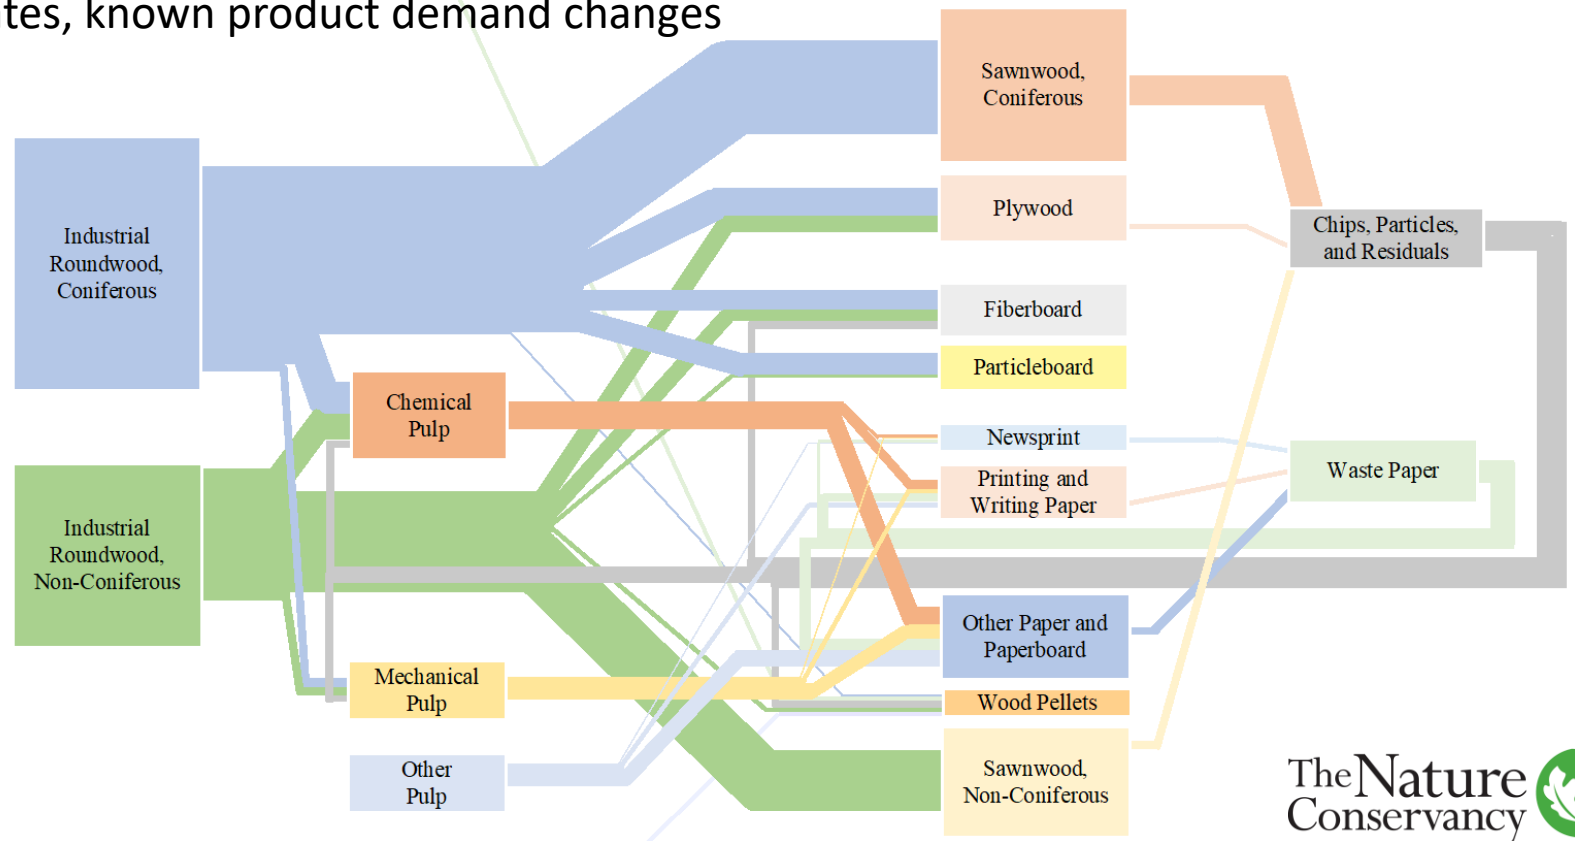

Phase 3: Global Trade Impacts

- FOROM: estimates changes in wood products harvested and traded

Phase 3: Global Trade Impacts

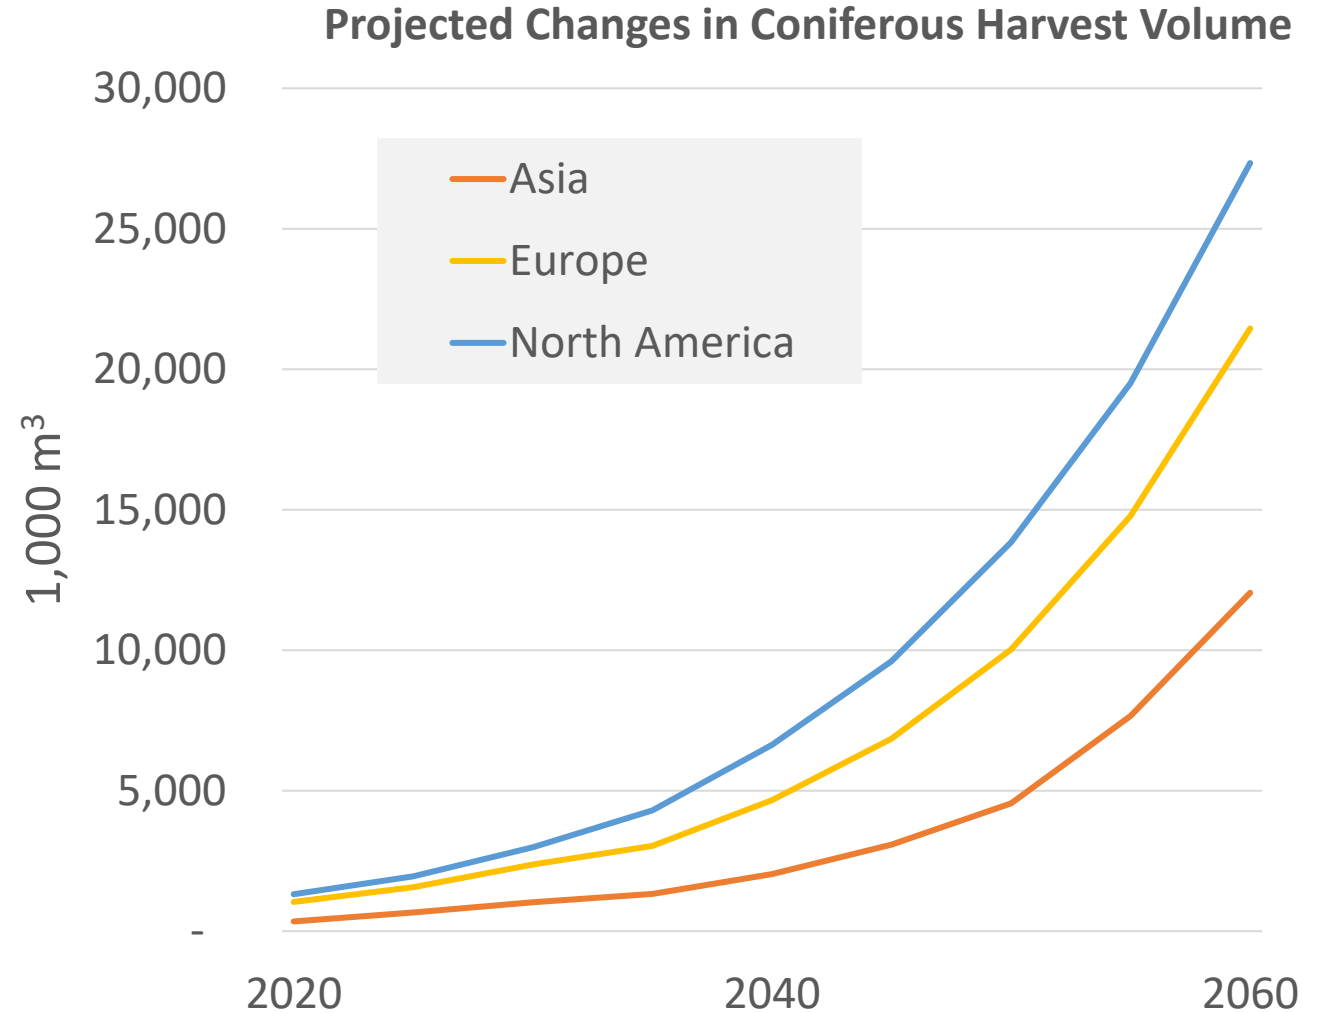

- FOROM: estimates changes in wood products harvested and traded
- Uses social, economic, and environmental predictors
 - Regional population, GDP estimates, known product demand changes
- Mass timber demand → Wood volume consumed

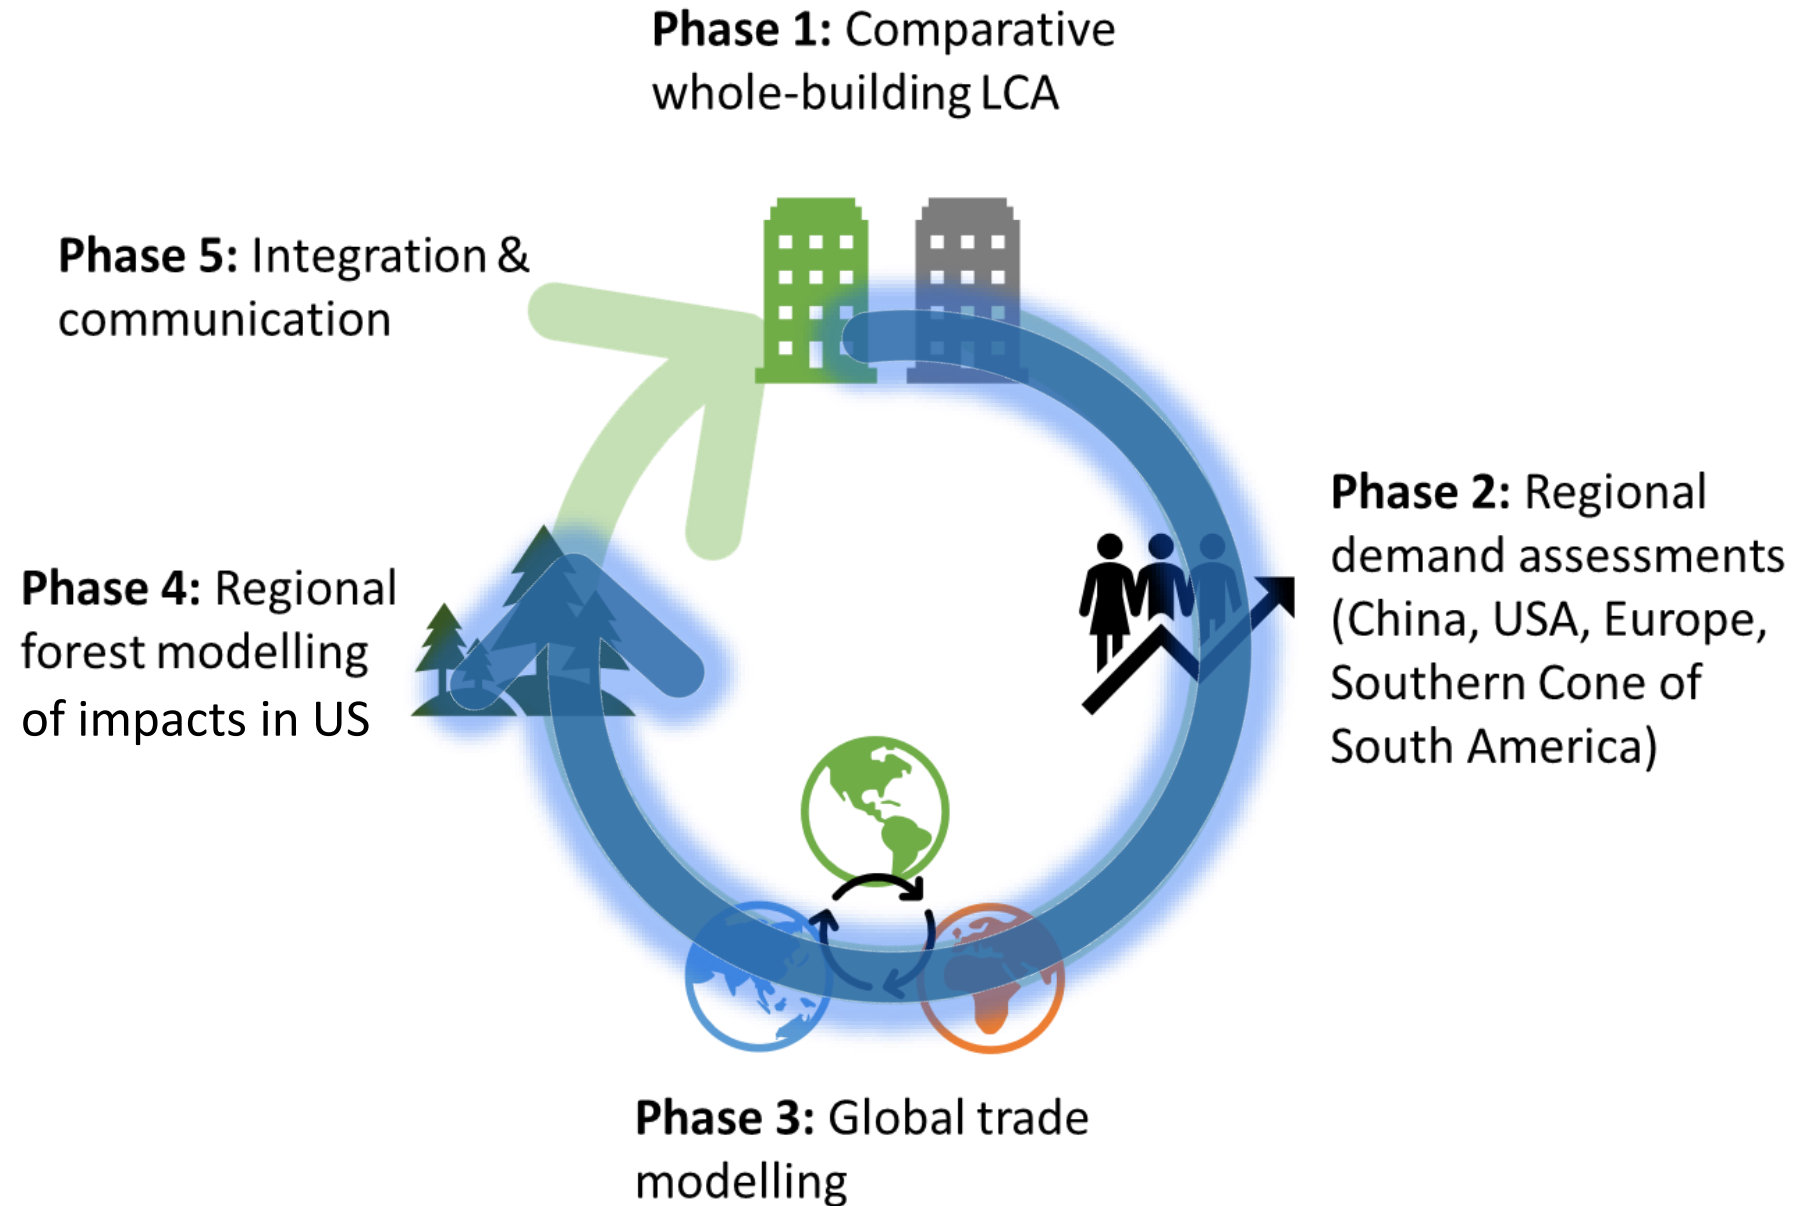

Phase 3: Global Trade Impacts

Key Lessons:

- Increased MT demand will likely increase harvest of coniferous species in MT producing regions
- Context is key.
 - Global - ~2%
 - Asia – 4% increase
 - Europe – 2%
 - N America – 1%

Phase 4: Regional Forest Modeling

- Connecting regional demand changes to stand-level carbon impacts
- Incorporating
 - Production parameters
 - Logistical constraints
 - Biological variables
- Exact model form, frame in development currently
 - Several scenarios
 - Simple → Complex

Assessing Business-as-Usual Harvest Patterns

Step 1: Determine variables used to define BAU harvest frames

Dependent variables:

- harvest intensity
- harvest occurrence

Independent variables:

- Elevation
- Site productivity
- Ownership
- Political boundary
- Ecoregion

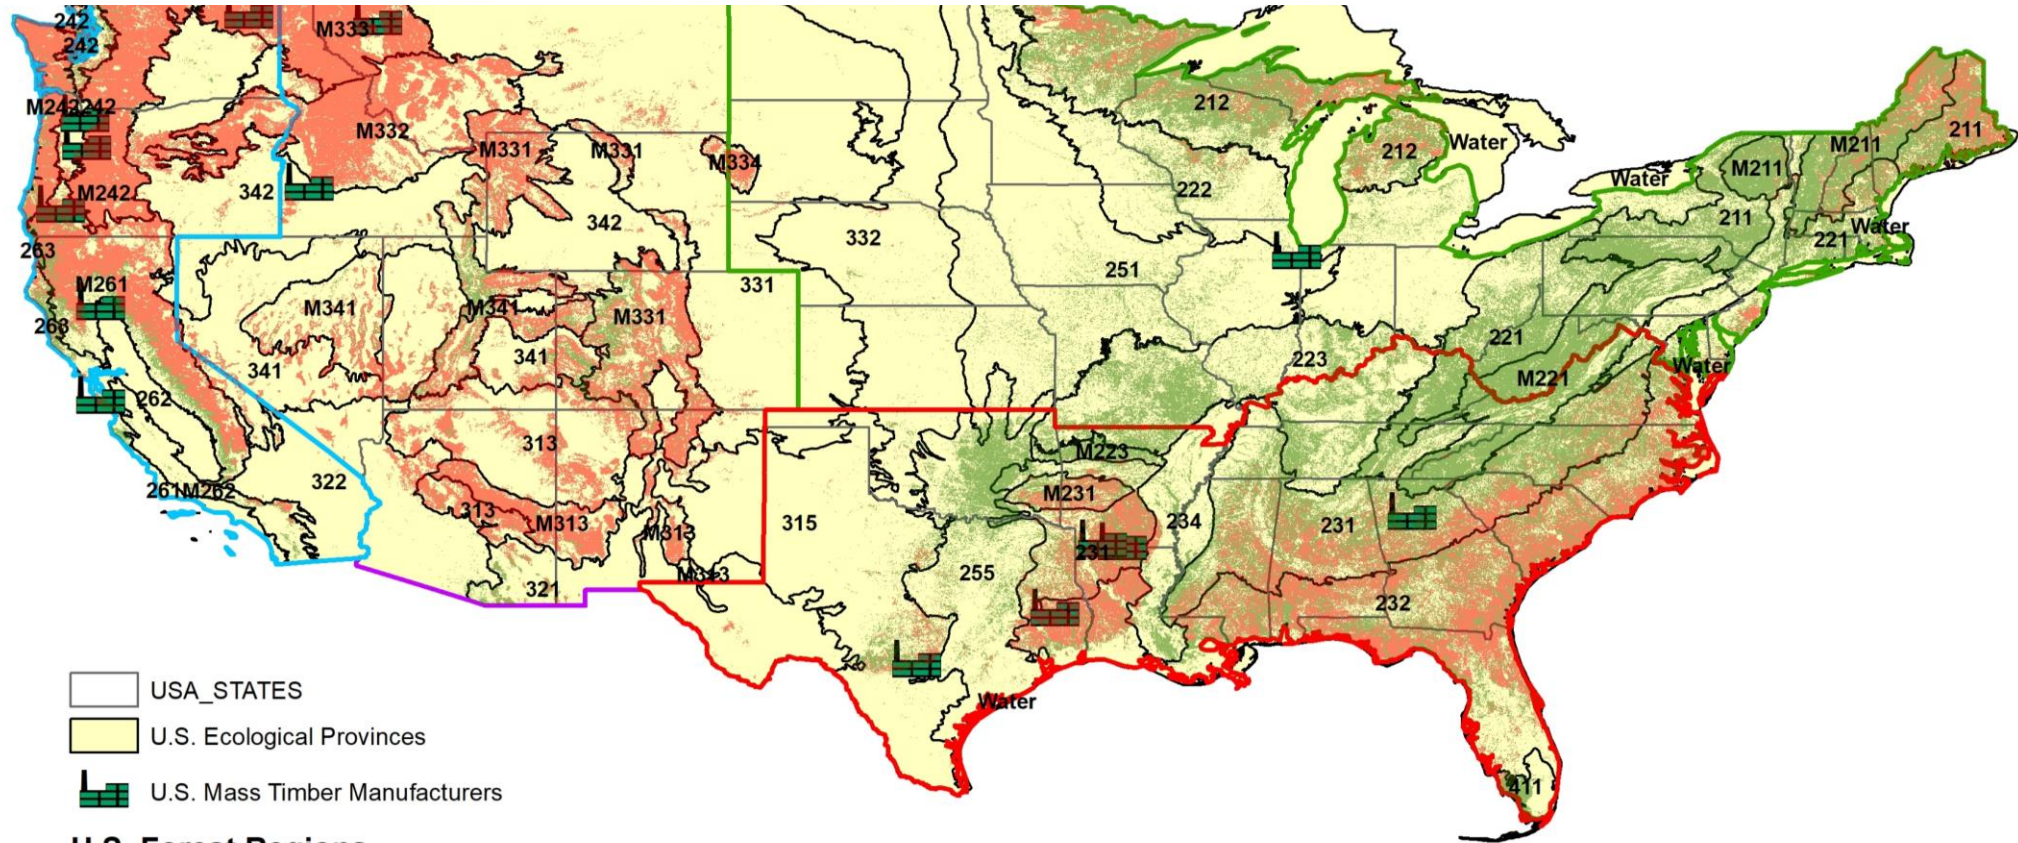

Step 2: Assess “average” BAU harvesting in a set of analytical frames

- Frames must necessarily be mutually exclusive
- Accurate, compact, applicable,

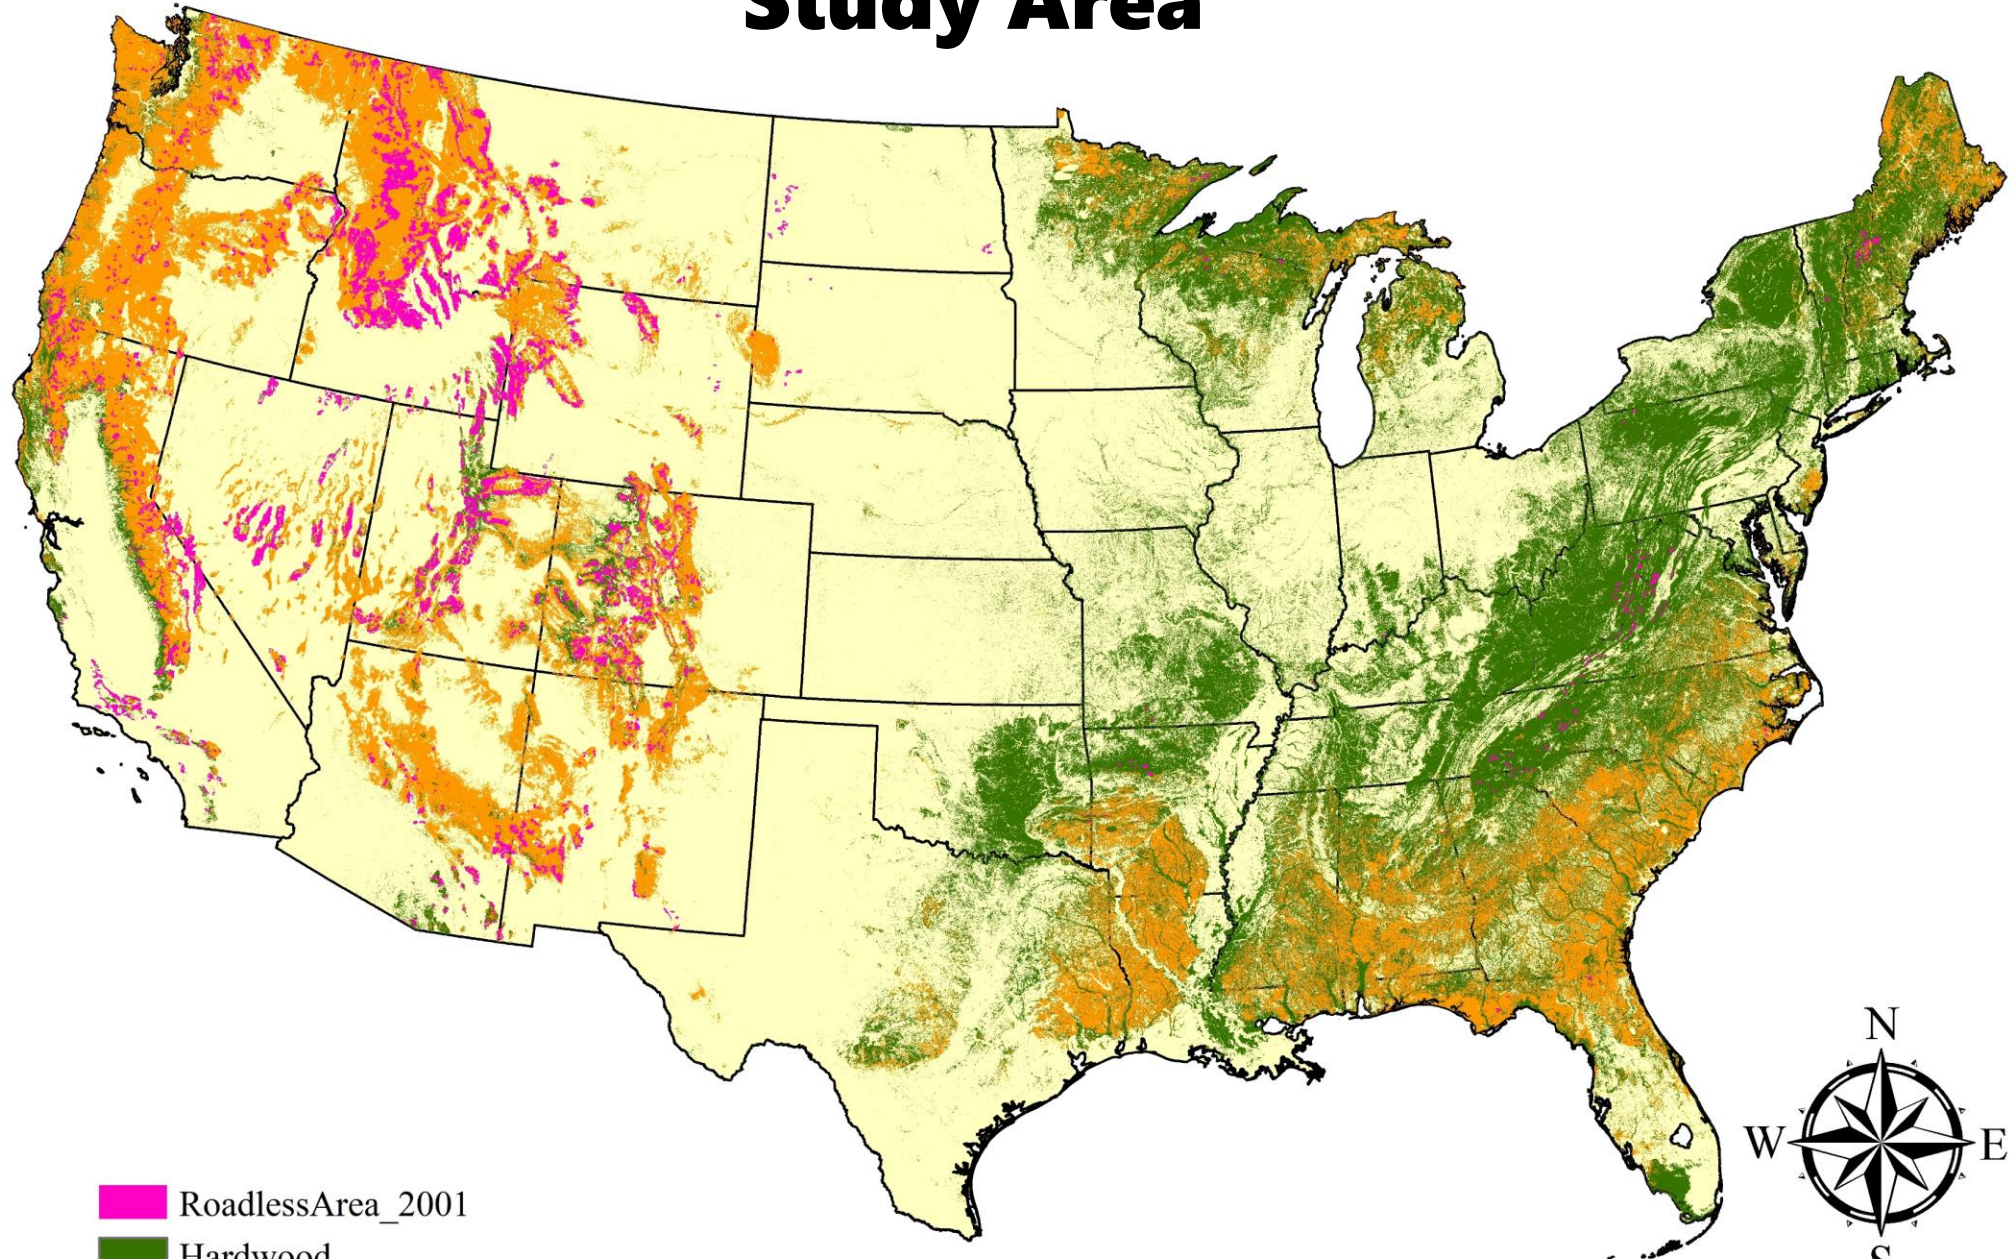

Regional mass timber impact assessment

-  Hardwood
-  Softwood

0 160 320 640 960 1,280 Kilometers

Work conducted for the past next 6 months

- Mass timber study
- Forest condition assessment in PNW area
- Harvest pattern model development

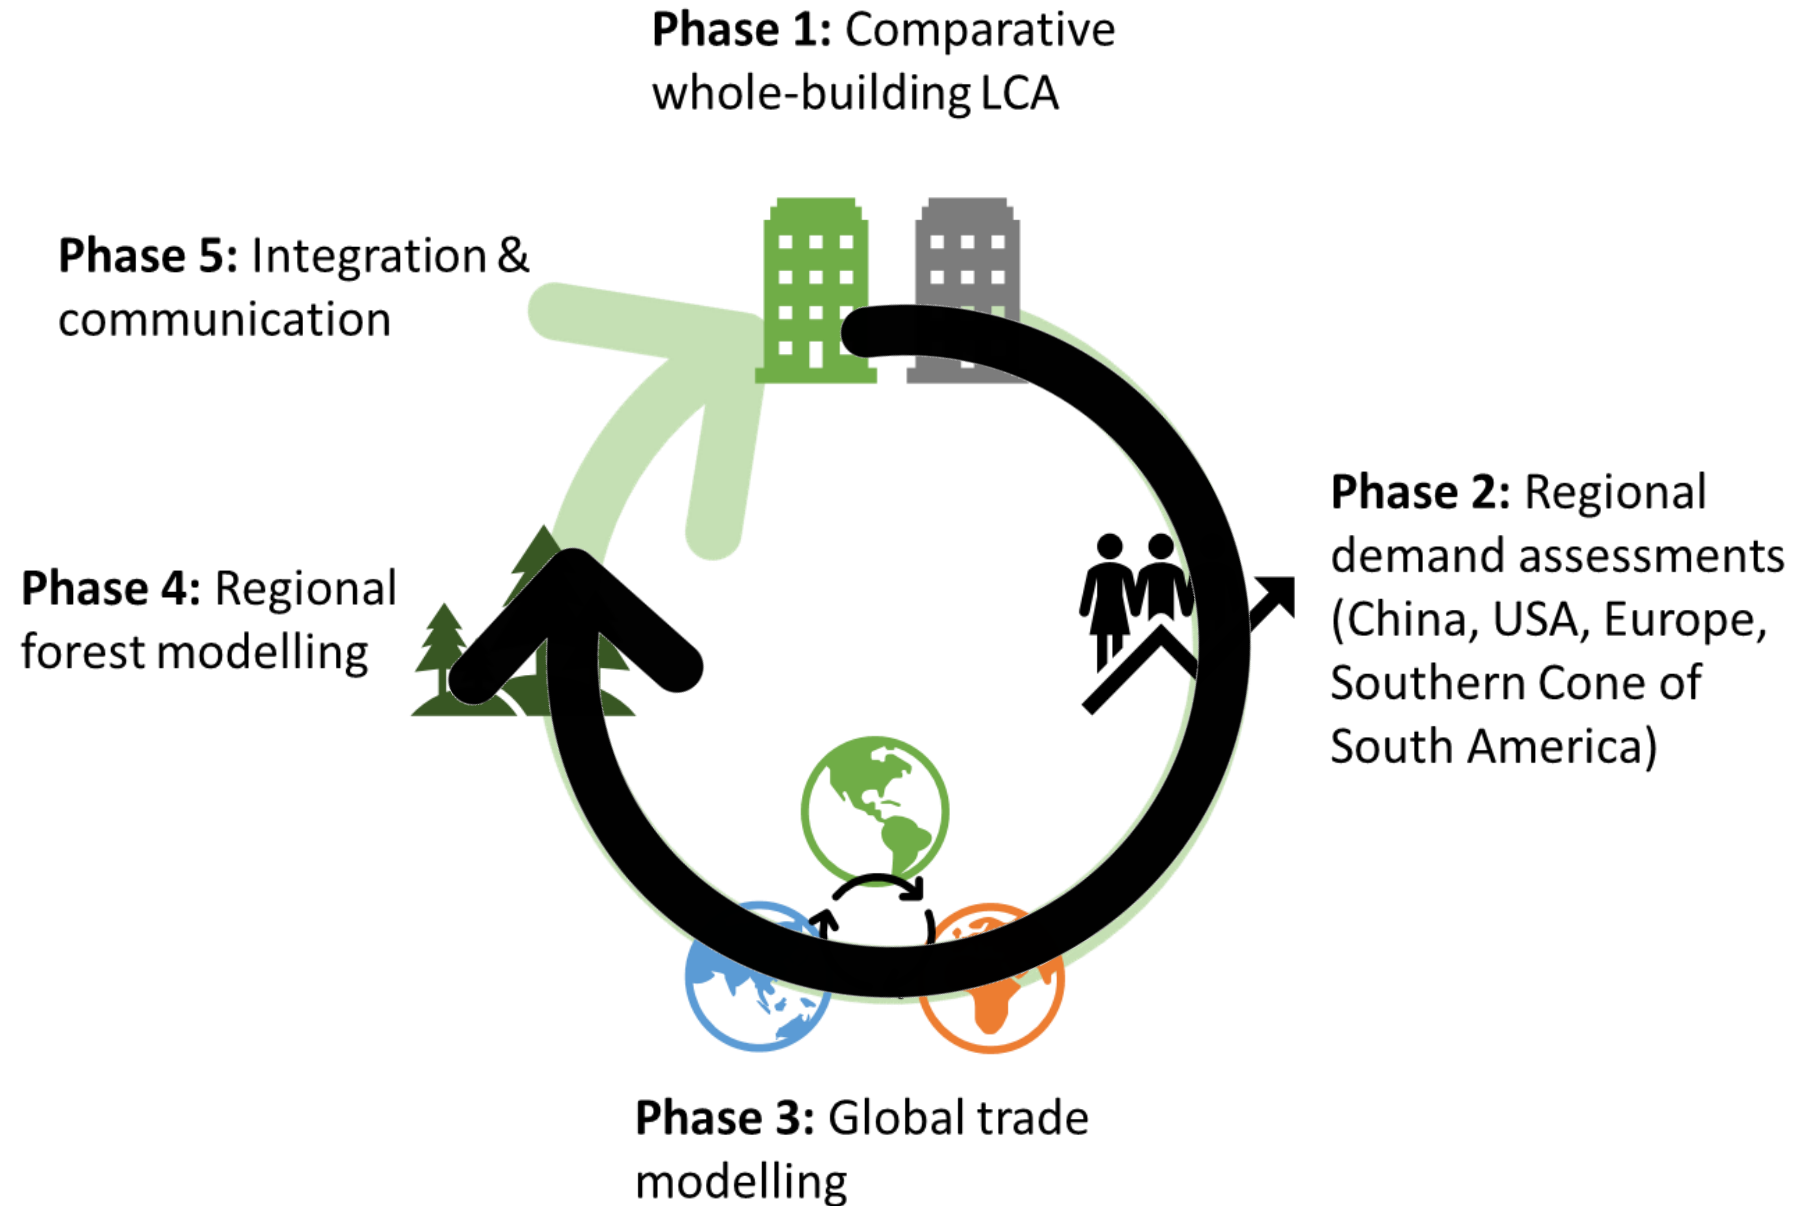

Workplan for next 6 months

Create	Create a set of mass timber harvest scenario based on Phrase 2
Run	Run FVS to see the impact on forest carbon associated with/without extra timber harvest for mass timber use
Incorporate	Incorporate computed climate change scenarios and natural disturbance scenarios

Phase 4: Regional Forest Modeling

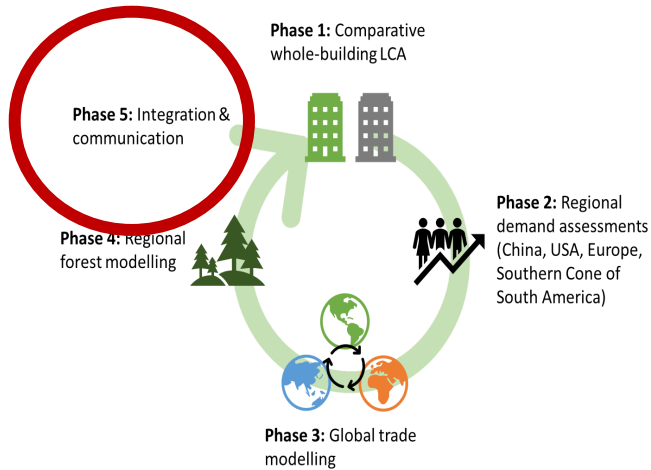

- Expected outcomes
 - Concentrated mgmt. will have... concentrated impacts
 - If harvest increases are dispersed, carbon stock declines should be minimal
 - What if... mass timber production parameters could be relaxed?

Phase 5: Project Integration & Collaboration

Further Research & Global Guiding Principles
