
The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, sex, religion, age, disability, sexual orientation, marital status, family status, status as a parent (in education and training programs and activities), because all or part of an individual's income is derived from any public assistance program, or retaliation. (Not all prohibited bases apply to all programs or activities.)

If you require the information on this poster in alternative format (Braille, large print, audiotape, etc.), contact the USDA TARGET Center at (202) 720-2600 (voice or TDD).

If you require information about this program, activity, or facility in a language other than English, contact the USDA agency responsible for the program or activity, or any USDA office.

To file a complaint alleging discrimination, write USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, or call, toll free, (866) 632-9992 (voice). TDD users can contact USDA through local relay or the Federal relay at (800) 877-8339 (TDD) or (866) 377-8642 (relay voice users). USDA is an equal opportunity provider and employer.

El Departamento de Agricultura de los Estados Unidos (USDA por sus siglas en inglés) , prohíbe la discriminación en sus programas y actividades ya sea por la raza, color, nacionalidad, sexo, religión, edad, incapacidad, orientación sexual, estado civil, estado familiar, su estado como padre o madre (en programas de educación y adiestramiento), ya sea que todo o parte de los ingresos provengan de cualquier programa de asistencia pública de las personas, o por represalias. (No todas las prohibiciones se aplican a todos los programas o actividades.)

Si usted necesita la información de este anuncio en un formato diferente (Braille, letras grandes, o por medio de sonido, etc.), llame al Centro TARGET del Departamento de Agricultura al teléfono 202-720-2600 (voz o TDD).

Si usted necesita información sobre este programa, actividad o instalaciones en un idioma diferente del inglés, llame a la agencia del Departamento que maneja este programa o actividad, o a cualquier oficina del Departamento de Agricultura.

Para someter una queja de discriminación, escriba al USDA, Office of Civil Rights, 1400 Independence Avenue, SW, Washington, DC 20250-9410, o llame gratis al 1-866-632-9992 (voz). Para llamadas TDD, llame al USDA al número 1-800-877-8339 o al número 1-866-377-8642. El Departamento de Agricultura ofrece oportunidades de programas y de empleo libres de discriminación.

Hops: Cost of Production

Rob Sirrine

Great Lakes Hop & Barley Conference

April 10, 2015

MICHIGAN STATE UNIVERSITY | Extension

Outline

- Trellis Setup and Hopyard Design
- Hops: Stages of Production/Processing
- Associated Management Practices & costs
- Cost Overview
- Market Outlook

Hop Value-Chain

Marketing/Sales

Hammer Mill & Pelletizer

Whole cone

Pellets

Table 1. 2013 Hopyard Preparation and Establishment Costs (Per Acre and Per 5 Acre yard)

Land Preparation		Per Acre	Notes		5 Acre Yard
Disc	$	26.00	$26/acre	$	130.00
Establishment					
Post Holes- digging	$	312.50	2.5 hrs * $125/hr (145 hp tractor)	$	1,562.50
Post Holes-placement	$	750.00	6 hrs * $125/hr	$	3,750.00
Poles-field	$	1,590.00	50 @ $30/pole	$	7,950.00
Poles-end~	$	1,840.00	46 @ $40/pole	$	5,360.00
Earth Anchor	$	650.00	50 per acre @ $13 each	$	3,250.00
Wire	$	1,000.00	Galvanized 7 strand ($800) + #9 ($200)	$	5,000.00
Misc Hardware/supplies	$	500.00	staples, etc.	$	2,500.00
Labor-poles	$	480.00	4 workers- $10/hr x 12 hrs	$	2,400.00
Management	$	240.00	12 hrs @ $20/hr	$	1,200.00
Hop Plants	$	3,000.00	($3/plant, 1000 plants per acre; 14' x 3.5')	$	15,000.00
Labor-planting	$	700.00	(70 hrs x $10/hr)	$	3,500.00
Irrigation^	$	1,500.00	Includes installation	$	7,500.00
Well			Variable		
Total Initial Costs	$	12,588.50		$	59,102.50

~ For a 5 acre yard: 53 field poles/ac & 27 end poles/ac=265 field poles and 134 end poles or 80/acre

^ 50 gallon/min, 2 inch main (no filtration)-cost is variable depending upon needs, # zones, etc.

Hops: Trellis Design

MICHIGAN STATE UNIVERSITY | Extension

Climbing bines

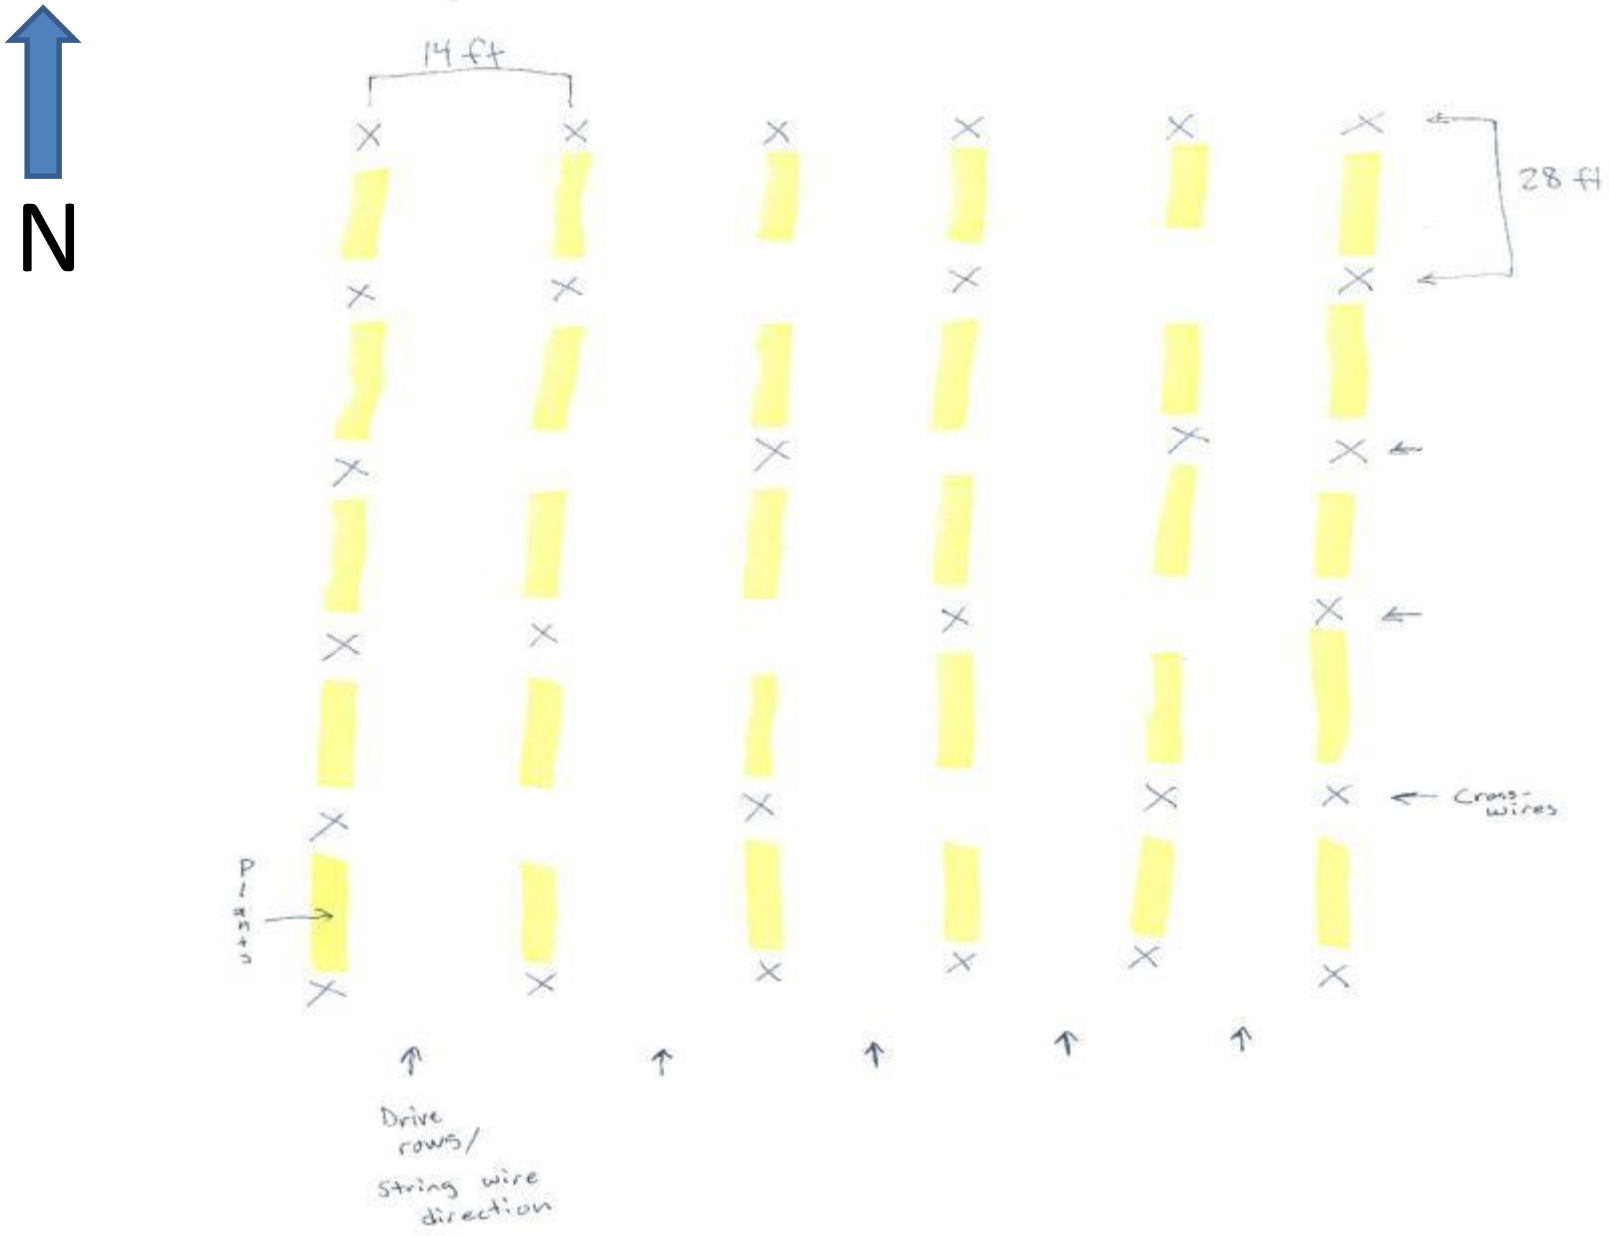
- Bine climbs with the aid of "Trichomes"
- In the wild-they climb up companion species
- Commercial production- Requires a trellis system for support
- Typical set-up
  - 18' tall
  - Plants spaced 3' x 14'
  - 1000-1200 plants/acre

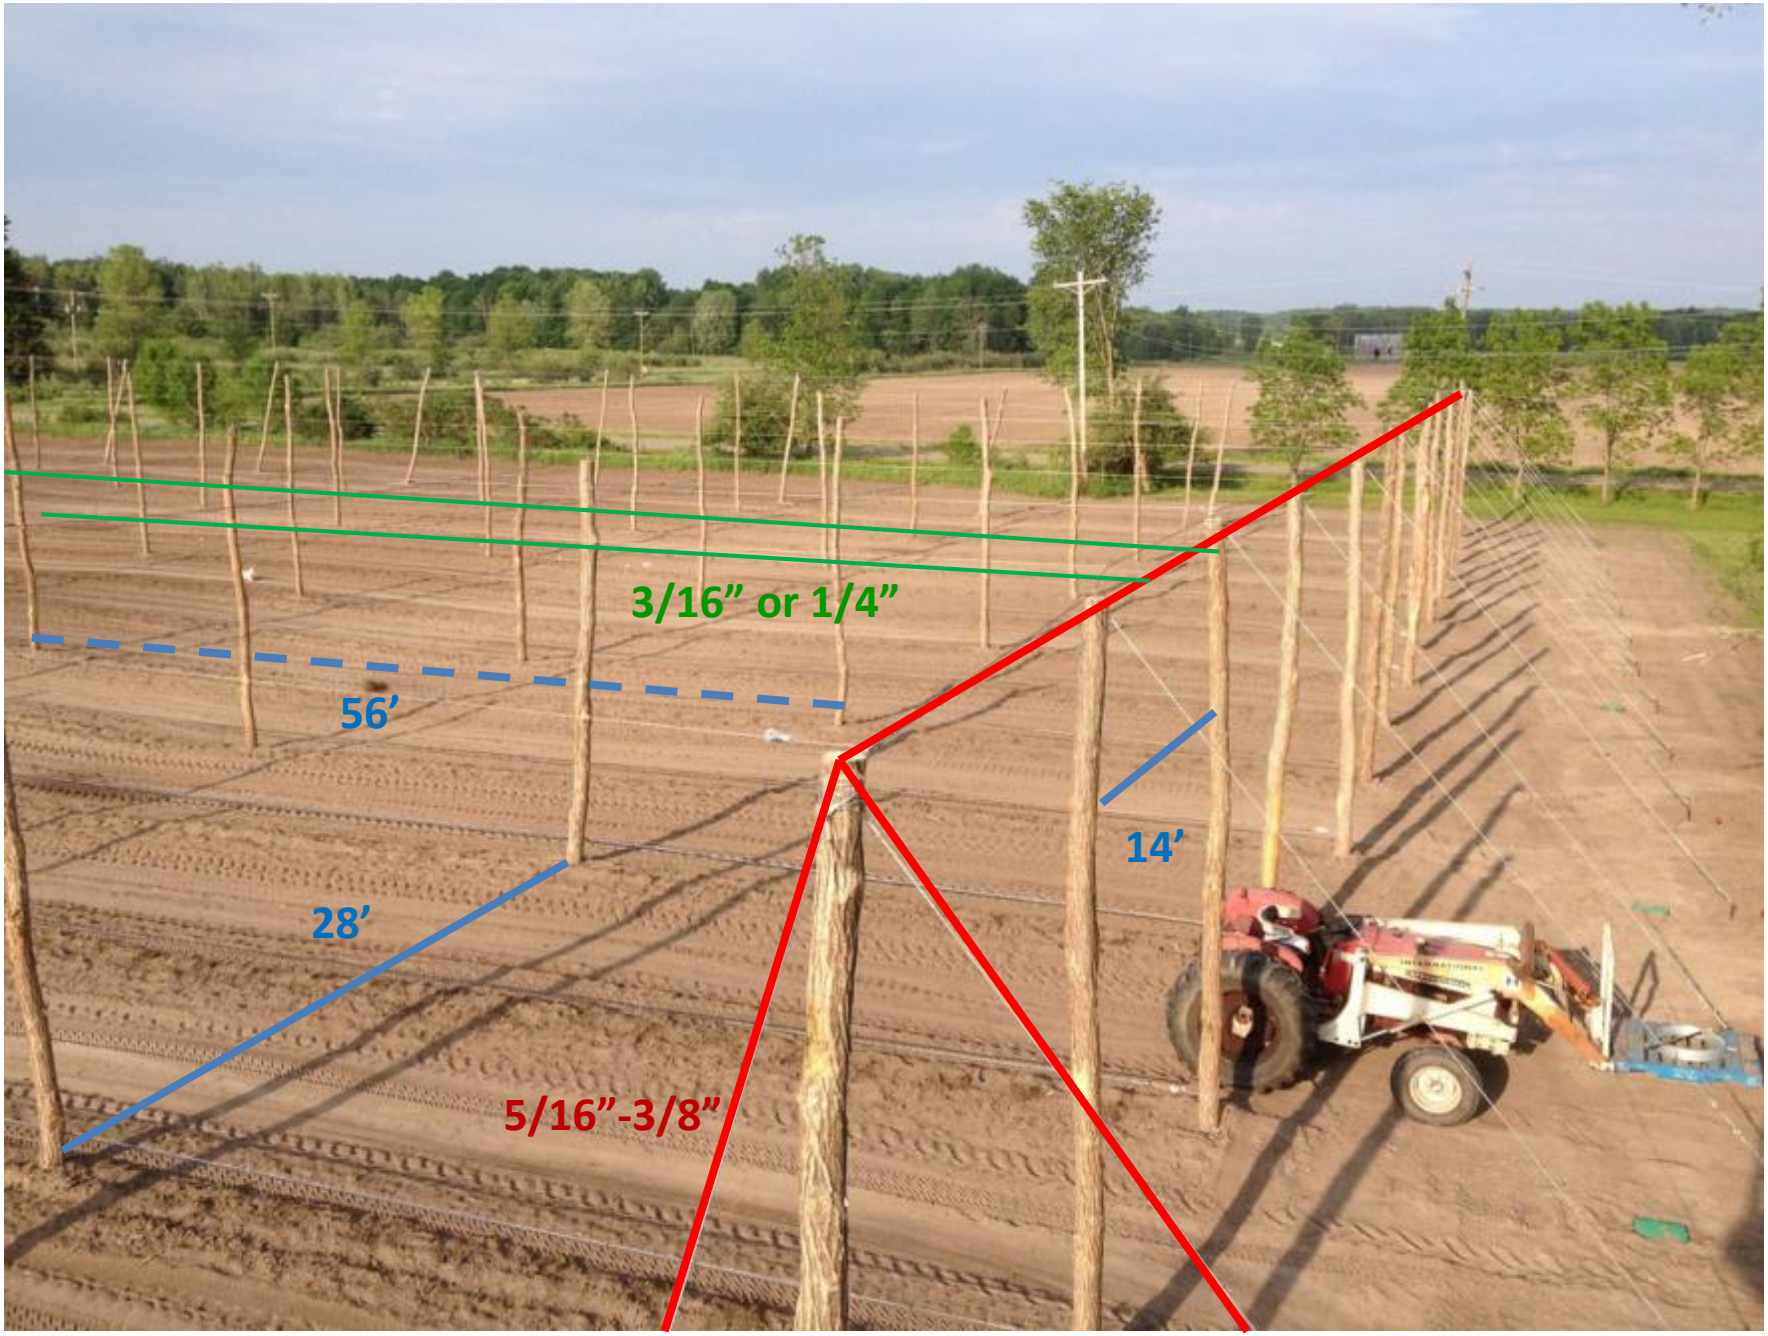
- Vine wraps around string-clockwise-function of phototropism (light) and thigmotropism (touch)

Conventional High Trellis

686GXR

Standard Tall Trellis Hopyard Design





Carr creek hops

Important to build a Solid Trellis!!

Short Trellis

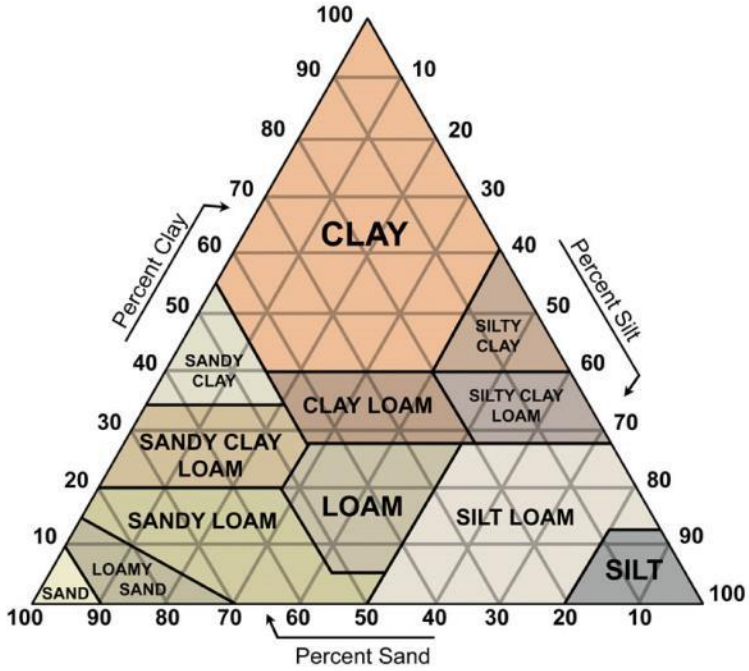
- 3’ x 8’, 9’, or 12’
- Labor Reduction
- Lower Establishment Cost
- Lower yields
- Ill-adapted varieties

Factors that can impact hop production (growth, yield, and quality) & your net returns

- Environment (temp, day length, soil texture, weather)
- Production Practices
  - Cultivar
  - Soil fertility
  - Disease, pest, and weed pressure and control
  - Training and timing of training
  - Harvest and harvest timing
  - Irrigation
  - Post-harvest processing and storage

Environment

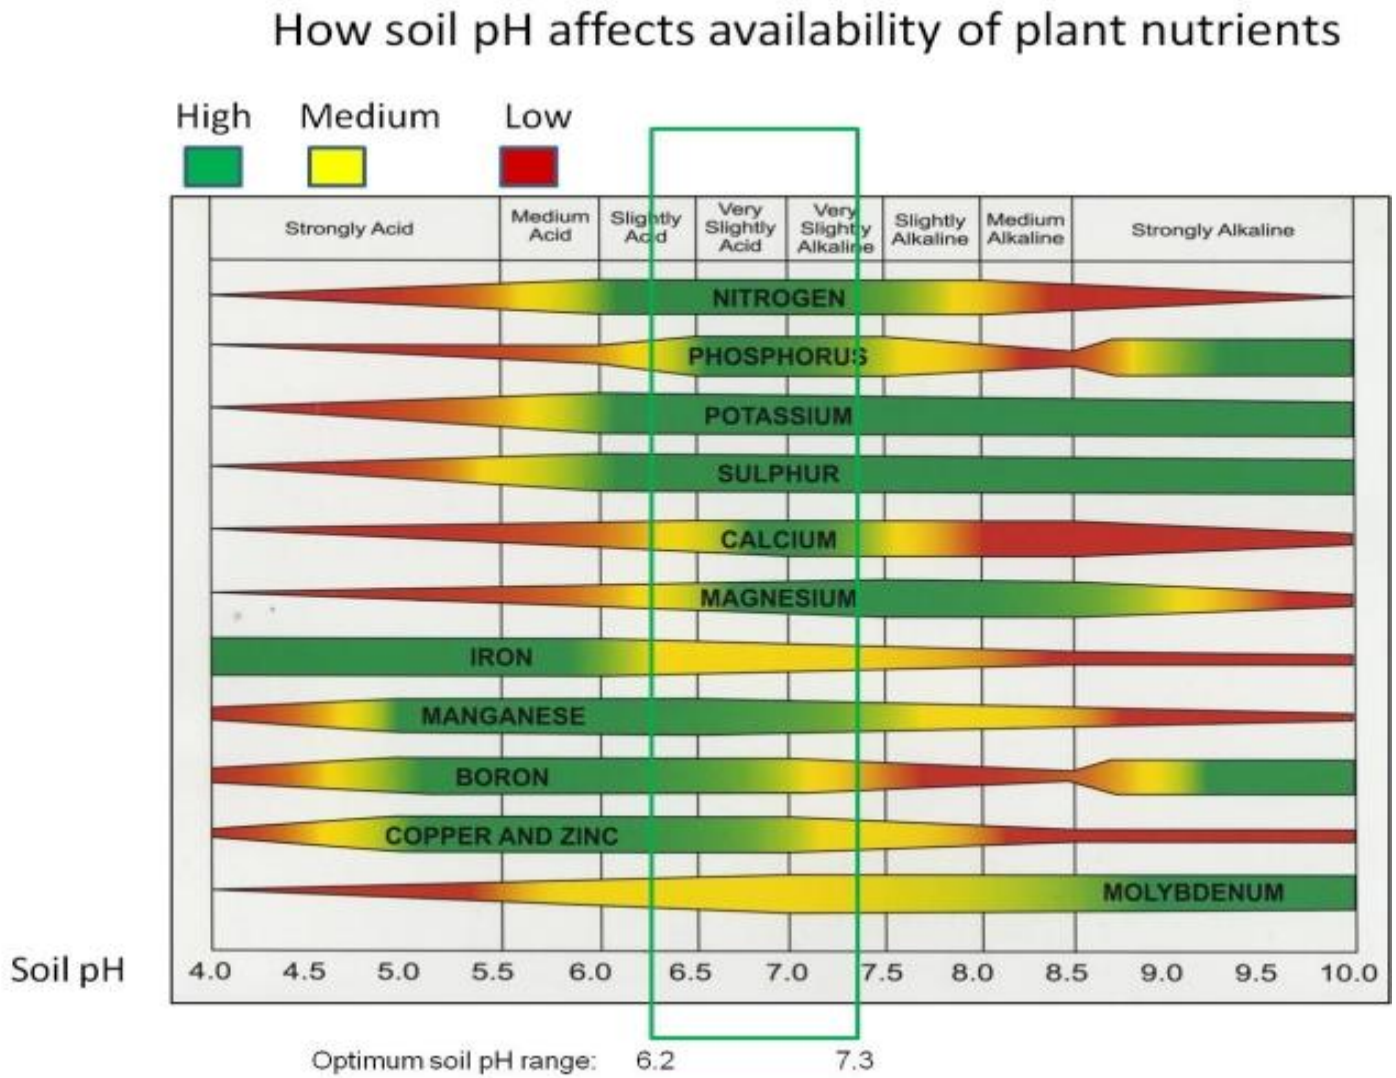
- Grow in a variety of soils from clay to sand
- Prefer well-drained soils
  - Sandy loam or silt loam
- Problem with heavy, poorly drained soils
  - May delay getting into field
  - Increase disease issues/rotting
- Problem with overly sandy soils
  - Hi input costs



Source: Neve, R.A. Hops. 1991

Hops and pH

- pH optimum(6.2-6.5)
- Lime if too low



Hop Production Stages

- Stages of Growth
  - Dormancy
  - Spring regrowth
  - Vegetative growth
  - Reproductive growth
  - Preparation for dormancy
- Each stage requires its own unique management regime & associated costs

Source: Jason Perrault, Perrault Farms

FALL/WINTER

Dormancy (October-March)

- In late summer the plant allocates photosynthetically derived starches to the storage roots
- Starch is converted into soluble sugars
- Sugars are the energy needed for spring-regrowth

- In the field
  - Not much happening
  - Planning for next season

Source: Jason Perrault, Perrault Farms

Variety selection

1. What brewers want
2. Yield
3. Disease resistance
4. Location-soil type, etc.

These will affect your bottom line

Spring Regrowth (April-May)

- Increasing day lengths and temperatures -signal end of dormancy
- Plants emerge from dormancy
- Initial regrowth occurs-rapidly producing vines unsuitable for production
- Plant uses energy reserves through May, when the starches and sugars reach their lowest points of the year
- Supplemental nutrient management is needed

NOTES

(a) Apply 1 week or so before spring growth begins.
(b) Apply 1 week or so before bloom.
(c) Work into soil immediately or water in with a minimum of 1/2 inch of water.
(d) Apply in early spring.
(e) Apply at bloom.
(f) Apply at bloom.
(g) Sulfur applications including the sulfate form of 50 lbs/acre or more need to be applied at least 6 months prior to next soil sampling.
(h) Apply an additional 250 lbs/acre of Potassium Sulfate (0-0-50) during the growing season.

NOTE: Could use compost here if Ca & Mg levels in the compost are not too high. Should not be applied though without an analysis first to determine the effects this would have on soil nutrient content.

Planting

- Michigan is moving away from rhizomes
  - Disease
  - Reliability
  - New local supplies of certified plants
- Plant starts can be planted throughout the growing season but generally in spring
- Have your trellis and irrigation in place before planting
- Before you purchase quantity, get some sample plants and send them immediately to your University lab

Photo Credits: Great Lakes Hops

Table 1. 2013 Hopyard Preparation and Establishment Costs (Per Acre and Per 5 Acre yard)

^ 50 gallon/min, 2 inch main (no filtration)-cost is variable depending upon needs, # zones, etc.

Pruning/crowning

- At least 2000 strings/acre (2 per plant)
- Video

http://roguefarmsblog.wordpress.com/category/crops/hops-crops/

Somewhere In Michigan

Options for stringing

1. W clips

Options for stringing

2. Tie strings to a lower wire

http://onspecialtycrops.wordpress.com/2013/05/14/hop-update-may-14-2013-stringing-trellising-and-irrigation/

http://roguefarmsblog.wordpress.com/category/crops/hops-crops/

Training

- 3-4 bines
- Clockwise only
- Timing-Cultivar and weather dependent
- Will likely have to re-train

Table 2. 2013 Hopyard Annual Operating Costs (Per Acre)

	Year 1	Year 2	Year 3	Year 4	Year 5
Annual Operating Costs					
Coir (1 string yr 1; 2 strings yr 2 +, $.20/ string; clips $80)	$ 240.00	$ 480.00	$ 480.00	$ 480.00	$ 480.00
Labor-stringing (5 workers x 10 hours X $10/hr)	$ 350.00	$ 500.00	$ 500.00	$ 500.00	$ 500.00

Total Annual Operating Costs	**$ 2,565.00**	**$ 5,680.00**	**$ 5,680.00**	**$ 5,680.00**	**$ 5,680.00**

- Analysis does not include land cost or overhead like interest on loans, taxes, etc.
- Does include per hour rate for machinery, labor, and management that would be charged if hired out (opportunity cost)
- Standard trellis design is 3.5 x 14 ft ~1000 plants/acre

ADD MORE HOPS

Irrigation

- 75-80% of total annual hop water use occurs after mid-June
- Greatest daily amounts late July-early August
- Majority of roots are in top 4’
- Hops usually extract 50-60% from top 2’, but can extract water from 8’ or below
- Overall use around 30 inches/year, depends on season
- $-right size your well, different zones for different cultivars

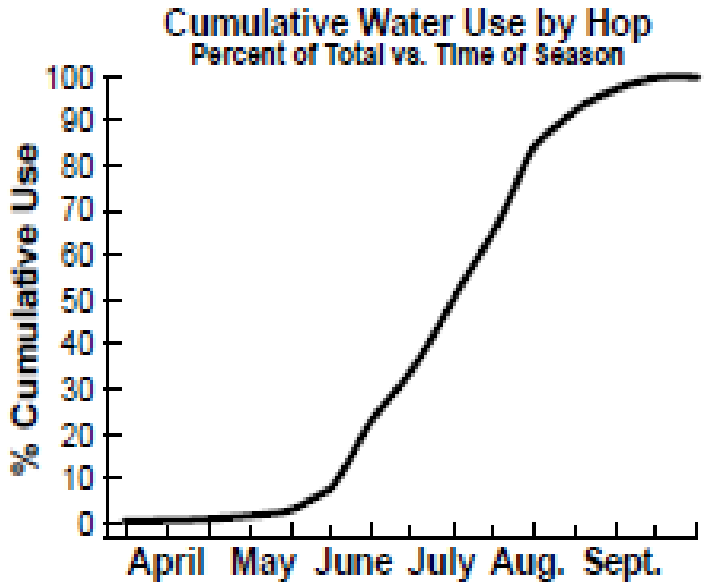

Fig. 1. Cumulative water use of hop during the growing season.

Evans, R. 2003. Hop Management in water short periods. EM4816. WSU Extension Bulletin

Irrigation: Examples

- Loftus Ranches
- Run two drip tubes per row
- 8 gallons per plant per day in hot season (4 on, 8 off, 4 on)
- ~8000 gallons/acre

Irrigation: Examples

NWMHRC

- Run one drip tube per row
- .42 gallon emitters every two feet
- RAM tubing
- 30 minute flush, 45 minute fertigate, 30 minute flush (every other day)
- NOT ENOUGH WATER

Fertigation

Vegetative Growth(May-July)

- Critical Stage for the purposes of crop production, occurs from end of May-end of July

- Two Phases:
  1. May-early July: Plant growth mainly in main vine and leaves
  2. July: Bulk of above ground growth occurs in the lateral production (side arms)

- Plant reserves used up
- Plant already determining yield
  - Aggressive management!!
  - Maximize health of plant & growth

Source: Jason Perrault, Perrault Farms

Vegetative Growth(May-July)

- In the Field
  - IPM-monitor, monitor, monitor
  - Pest/Disease/Weed Control
  - Fertility Management
  - Irrigation

Source: Jason Perrault, Perrault Farms

Hop Growing Requirements: **Fertility**

- Soil Test Before planting
- Tissues Tests and Soil tests
- Recommended fertilization rates:
  - Nitrogen (N) = 150 lbs/acre
    - Mid-April with urea (40-0-0) every 2-3 weeks then later come in with triple 16
    - End in July
    - No more than 25 lbs/acre at one time
  - Phosphorous (P) = 60-100 lbs/acre
  - Potassium (K) = 100 lbs/acre (potash)
- Eg. Yakima Valley

  Highest average yield included a 90 lbs. N/ac as a spring application, followed by 90 lbs. N/ac administered through fertigation, ending in June (180 lbs. of N/ac total)

Weed control

Pests and Diseases

- **Hop aphid** *(Phorodon humuli)*

- **Spider Mites** (*Tetranychus urticae)*

- **Potato Leaf Hopper** (*Empoasca fabae*)

- **Downy mildew**
  (*Pseudoperonospora humuli)*

- **Powdery mildew**
  (*Podosphaera macularis)*

- Analysis does not include land cost or overhead like interest on loans, taxes, etc.
- Does include per hour rate for machinery, labor, and management that would be charged if hired out (opportunity cost)
- Standard trellis design is 3.5 x 14 ft ~1000 plants/acre

End of July

- Floral Production has commenced
  - Plant shifts energy into cone production
  - Focus on: plant health to maximize cone weight and resin/oil content
  - Water management-July-August most of H2O
  - Nutrient management-cut off N, add K

Source: Jason Perrault, Perrault Farms

Preparation for Dormancy (September)

- Harvest!!!!!
- Vines cut (bottom then top)
- Laid down into trailer
- Taken to picking machine
- Cones dried for 8-12 hours (10% moisture)
- Cured
- Baled
- Cold storage

Source: Jason Perrault, Perrault Farms

Harvest Timing

Hops are harvested upon reaching the “technical ripeness” (highest brewing value), not at full or “physiological” maturity. Each variety has its own specific, genetically determined optimal time of harvest. Varies by the weather, location, biological window, and the cutting time.

Harvest time crucially affects:

- α-acid contents
- yield
- external quality (color and shine, infection with diseases and pests, shattering)
- aroma (aroma intensity, oil content and composition)
- vigor and vitality of the plant (in the next season)

↓

Economic interest of hop growers, traders and brewers

Results from harvest time studies

- 5 – 8 harvest times (2 dates / week), 4 replications with 20 bines each
- 3- 4-year-trials (climate, health and vitality)
- data for yield, α-acid contents, aroma, external quality, shortcomings assessed

Removing the guesswork

Harvest Package $50

- Combining Brewing Values (alpha acids, beta acids, and hop storage index (H.S.I.)) and Dry Matter analysis, the Harvest Package is designed with hop farmers in mind.
- Results provide growers with content and characteristics of their hops and/or fields and can be utilized on an annual basis to establish trends within a given hop variety or lot location.
- Prior to harvest, these results specifically equip growers with the necessary information to plan peak harvest windows and make informed decisions regarding alpha content, hop cone maturity and overall hop quality.
- Require a 200g sample and a minimum 1 day turnaround.

Degradation potential

- Distance?
- Humidity level?
- Time of harvest (early a.m. or noon)?
- Temperature at harvest?
- Cost

In terms of the drying process picked hop cones can be regarded as a living organism whose basic life processes, particularly respiration, are continuing. They first react to being removed from the plant by a higher intensity of respiration. Rybacek, 1991.

UVM Modular hop oast

NW CROPS & SOILS PROGRAM

UNIVERSITY OF VERMONT EXTENSION
CULTIVATING HEALTHY COMMUNITIES

Modular Hop Oast

Introduction

Hops are commonly harvested at 75-80% moisture by weight, but are ideally pelleted, packaged and stored only after they are dried to 8-10% moisture. To put this into perspective consider that a pound of "dry" hops starts out with about 3 pounds of water (a little less than a half gallon) that has to be evaporated by drying.

In large, commercial hop production whole buildings are dedicated to the careful process of drying hops to the desired storage moisture. Given the nascent, distributed, and small-scale nature of Vermont's resurging hop industry a different approach is needed. To this end, a modular hops oast has been developed and demonstrated by UVM Extension and Borderview Farm. This oast is designed as an integrated cabinet drier that holds trays of hops. The drying is accomplished with a fan, heater and controller.

The oast includes two 4'x4'x8' cabinets with independent access doors and controls. Total capacity is 600 lbs wet hops which can be dried in 8 hours.

Different hop varieties can be kept separate in the oast by placing them in different trays. A total of 8 trays can be accommodated in each cabinet. Wire mesh is used as the bottom for the trays which allows air flow through the hops.

Design

The aim of the design is to use readily available materials and common construction skills and to result in a modular and scalable oast that supports hop growers of various scales. A base module of 4' W x 4' D x 8' H makes use of standard building materials well and allows for conveniently sized hop trays. All of the main structure is made with standard construction lumber and plywood. The electrical system is 220 VAC single phase and uses fairly common parts and wiring. The fan motor is 1/4 hP and the fan impeller is a 24 inch vane axial design capable of 3250 CFM at 0.7 iwc pressure rise (at 1750 RPM). The majority of air flow is circulation within the cabinet, however in order to dry the hops the humidified air must be removed. Holes are drilled in the top of the cabinet at high pressure and low pressure areas along the impeller resulting in exhaust and fresh air intake respectively. The placement of these holes and the degree to which they are open or covered determines how much "stripping" air is pulled through the cabinet. The heating element is a 3500 Watt bent tubular heater. Although one can dry hops using unheated, ambient air, the addition of well controlled heat to the air allows for quicker drying reducing labor and maintaining higher quality hops. The components used in this oast have been selected to dry 300 lbs of wet hops from 80% moisture to 10% moisture in 8 hours with little to no labor required.

The fan and heater are installed on the ceiling of the cabinet. A PID controller (inset) rests on top of the cabinet and ensures temperature control.

A proportional-integral-derivative (PID) controller has been used in this system. This type of controller allows the user to set a target temperature and by monitoring the actual temperature in the cabinet using a thermocouple it "zeroes" in on the set-point. This differs from a thermostatic control which would provide an "average" temperature of the set-point but with sometimes wide fluctuations above or below it. The PID controller is always monitoring the difference between the set-point and the actual temperature, the historical difference, and the rate at which this difference is changing in order to predictably adjust the heater operation to attain the desired temperature.

Cost (per 4'x4'x8' cabinet)

Lumber/Screws/Hardware	$246
Angle Iron for Tray Rack	$104
1/3 H.P. Fan Motor	$110
Fan Blades (from Multi-Wing)	$78
Heating Elements 3500 Watt (from Chromalox)	$332
Controls	$100
Total Materials	$970
Labor	30 Hours

Plans for the UVM Modular Hop Oast including design drawings, a bill of materials, and a description of the machine are available for download from http://www.uvm.edu/extension/cropsoil/wiki/.

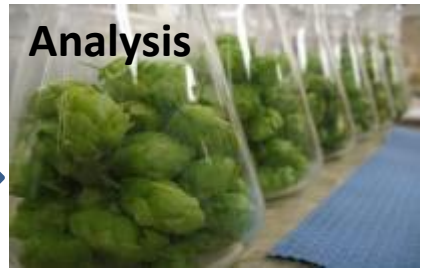
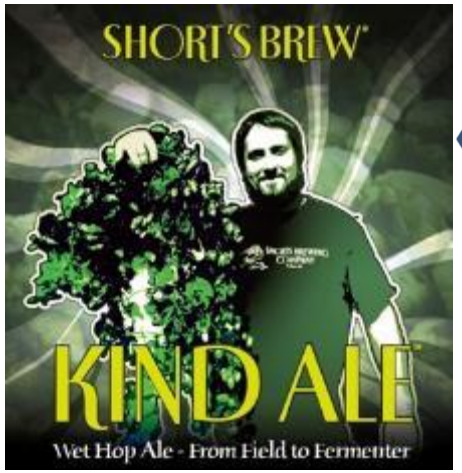
Louvered, multilevel Hop Dryers

- Louvered Dryers are exceptional space savers and easy to use.
- The drying process typically takes place on three levels, on two shelves and in louvered drawer.
- $8k + $4-6k

Yakima, WA

Hop Value-Chain





Hammer Mill & Pelletizer

Marketing/Sales

Whole cone

Pellets

Conditioning

Considerations

- Humidity- (In 2 hours you could go from 9% to 13% moisture)
- Throughput and timing
- Space requirements
- Food safety?

- The hops are left in these heaps for 12 hours in a staged process known as “conditioning”.
- The heaps are re-piled for a further 12 hours across the floor in which time the moisture level continues to equilibrate to ensure consistency prior to baling.
- Target moisture level for our hops is around 9.5 % (+/- 1 %) which requires a high level of patience and skill to achieve.

Baling

Considerations

- Timing
- Quantity of hops
- Size
- $$ baler
- Storage
- Transport

“Whole leaf hops are voluminous, but turning them into a bale makes them more compact and stackable, and overall easier to store. It also cuts down on oxidation, which affects brewing quality.”

Mechanical German RB-60 Presses / Balers ~$7k

Hop Analysis Services

Harvest Package $50

- Combining Brewing Values and Dry Matter analysis

Hop Profile Package $130

- Combining Brewing Values, Oil Content and Volatile Oil Profile analyses, this package is designed to help customers determine the alpha acids, beta acids, hop storage index and oil content of their hops.

Brewing Values $35

- Alpha acids, beta acids, and hop storage index (H.S.I.) values

Dry Matters $20

- Dry matter analysis provides growers with the necessary information to forecast peak harvest windows based on hop cone maturity

Oil Content $20

- Provides a value for the volume of oil in a hop sample

Volatile Oil Profile $100

- Volatile Oil Profile provides a specific value for the most important oil compounds

Packaging and Storage

Considerations

- Oxygen and Photosensitivity
  - Hops are photosensitive and, therefore, long exposure to light changes their biochemical structure as is shown by a typical red-brown colour, which is commercially undesirable.
- Package size and quality
  - 3-ply Al-folium bags under inert N2 atmosphere-vacuum sealed
- Cold storage-YES

Cold Storage

- For AB-This freezer keeps the hops stored within at a constant 18-26 degrees Fahrenheit at a 70% relative humidity.

Machinery/Labor -Mowing/Till	$ 100.00	$ 100.00	$ 100.00	$ 100.00	$ 100.00
Machinery/Labor- Spraying	$ 300.00	$ 350.00	$ 350.00	$ 350.00	$ 350.00
Subtotal	*$ 2,565.00*	*$ 3,830.00*	*$ 3,830.00*	*$ 3,830.00*	*$ 3,830.00*
Harvest					
Labor-harvesting (10 hrs, 4 workers-cut, load)		$ 400.00	$ 400.00	$ 400.00	$ 400.00
Management ($20/hr* 10 hrs)		$ 200.00	$ 200.00	$ 200.00	$ 200.00
Machinery ($125/hr)		$ 1,250.00	$ 1,250.00	$ 1,250.00	$ 1,250.00
Subtotal		*$ 1,850.00*	*$ 1,850.00*	*$ 1,850.00*	*$ 1,850.00*
Total Annual Operating Costs	**$ 2,565.00**	**$ 5,680.00**	**$ 5,680.00**	**$ 5,680.00**	**$ 5,680.00**

- Analysis does not include land cost or overhead like interest on loans, taxes, etc.
- Does include per hour rate for machinery, labor, and management that would be charged if hired out (opportunity cost)
- Standard trellis design is 3.5 x 14 ft ~1000 plants/acre

Post Harvest Costs					
Picking processing fees **($6/lb.)** (energy, supplies, labor, etc.)		$ 4,500.00	$ 6,750.00	$ 9,000.00	$ 9,000.00
Transport to processor (variable)		$ 500.00	$ 500.00	$ 500.00	$ 500.00
Interest on Equipment (picking machine, hammer mill, pelletizer)					
Sales Costs (Commission, transportation, shipping, etc.)					
Subtotal	*0*	*$ 5,000.00*	*$ 7,250.00*	*$ 9,500.00*	*$ 9,500.00*
Total costs	($2,565)	($10,680)	($12,930)	($15,180)	($15,180)
Gross Revenue/acre					
Percent of total yield- (full production 1500 lbs. dried/acre)	0	50%	75%	100%	100%
Total yield in pounds dried/acre	0	750	1125	1500	1500
Fresh wholecone wet ($5-6 /lb.)					
Wholecone dried ($10-12/lb)					
Pellitized ($14/lb)	0	$ 10,500.00	$ 15,750.00	$ 21,000.00	$ 21,000.00
Net Revenue/acre	**$ (2,565.00)**	**$ (180.00)**	**$ 2,820.00**	**$ 5,820.00**	**$ 5,820.00**

- UVM-$1.60/lb for picking only
- A couple of MI processors- ~$5.50/lb (including a 10% sales commission)
- Ontario $4.50/lb (no sales or marketing)
- Quebec and BC- (they charge 35% of sales amount) or currently $5.50/lb since they are selling for close to $16/lb (including access to mechanized harvester + dryer) and post-harvest services (including pelletization, packaging, commercialization)
- A group in Wisconsin was charging $4/lb just for pelletizing, packaging, and selling.
- **Depends on your assumptions (lbs per acre, cost of labor, payment on debt, etc.), but it looks like things are shaking out at around $5/lb for the process of picking through selling.**

Cost of Production per pound by variety

Hop Variety	Yield (lb/acre)	5 Yr Cost of Production ($/lb)	2 Yr Cost of Production ($/lb)	1 Yr Cost of Production ($/lb)
Ahtanum	1862	3.55	3.78	4.23

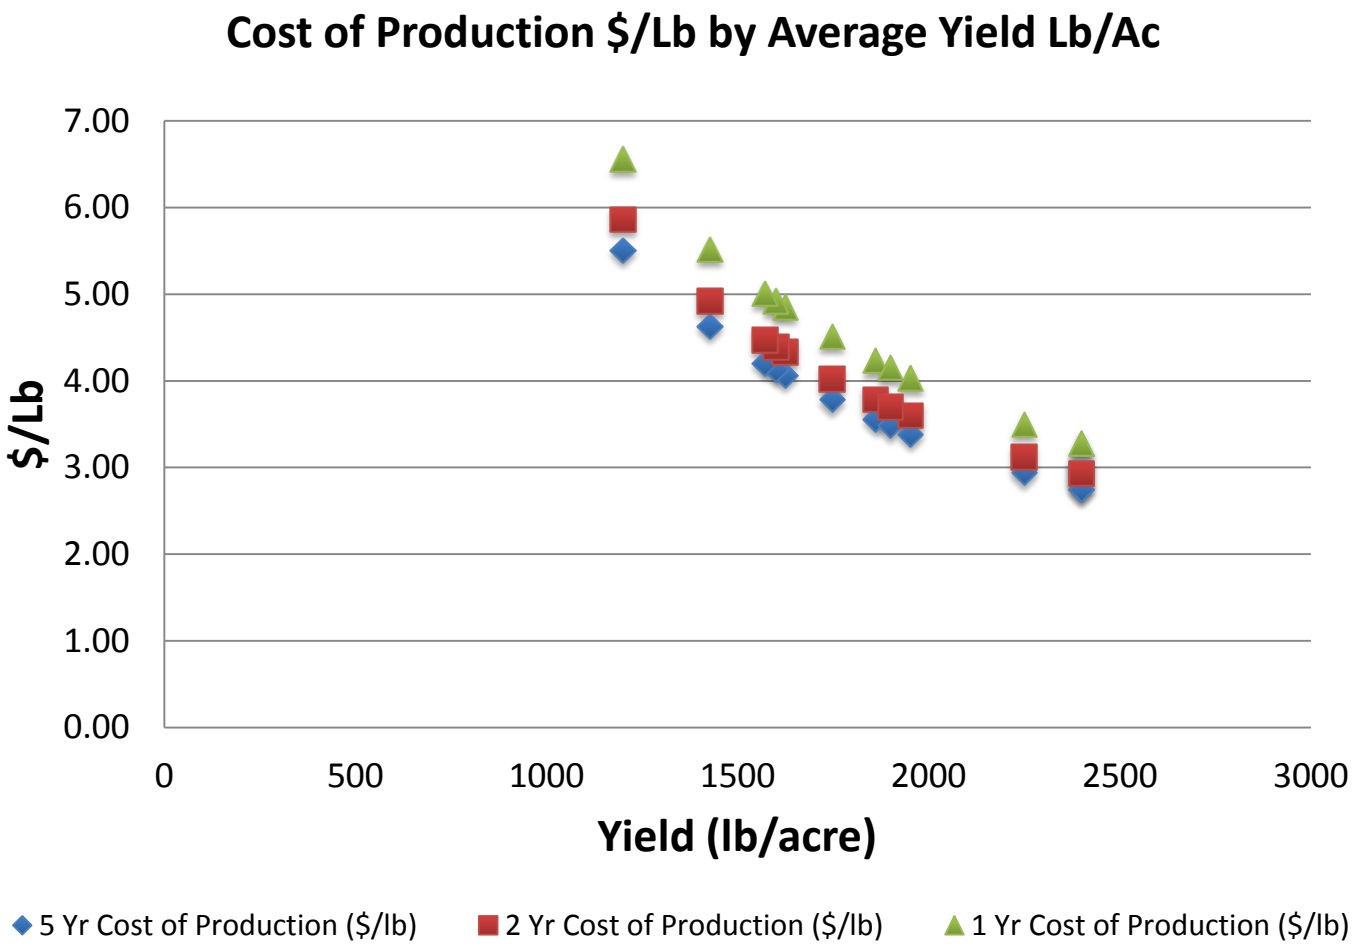
http://www.brewersassociation.org/best-practices/hops/cost-of-hop-production

Why variety and yield matter



- $R^2 = .95$, $p < 0.0001$

Training Date

1970-1973 Studied the effect of the date of training

a. Yield

b. Length of cones

c. Number of shoots

d. Density of setting (# cones per 10cm of shoot)

e. Mean length of shoots

May 12- Highest yield of fresh cones (2.05 kg)

June 1- Lowest yield (1.26 kg)

Late training reduced the yield by 38.5 % (June 1)

Early training reduced yield by 10.3 % (May 4)

Color of cones poorest with earliest training

Delayed training decreased mean length of harvested cones but increased their setting density

TAKE HOME: the date of training principally affects the yield of cones and their quality

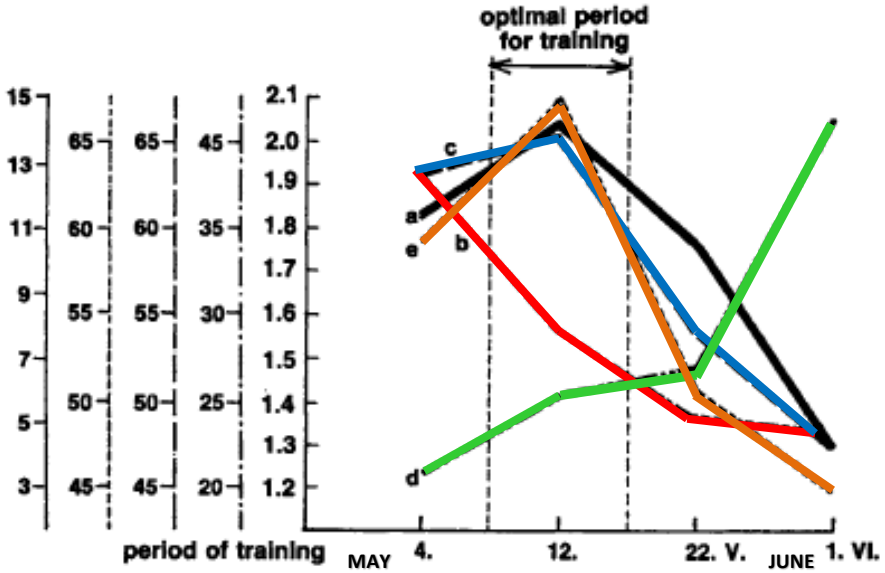


Fig. 93. Effect of time of starting training on the structure of the hop plant and on the yield of cones: a – yield (in kg) of fresh hop per plant, b – length of cones in mm, c – number of shoots, d – density of setting (number of cones per 10 cm of shoot), e – mean length of shoots (in cm).

RybaCek, V. 1991. Hop Production. Developments in Crop Science 16. Pg. 205

What if your maximum yield is 1000 lbs/acre?

Post Harvest Costs					
Picking processing fees **($6/lb.)** (energy, supplies, labor, etc.)		$ 4,500.00	$ 6,750.00	$ 9,000.00	$ 9,000.00

Concerns on the Horizon?

- **Hop Usage**
  - At 20% share, craft hop usage is 2/3 of current national production – even without increase in usage/bbl
- **Hop Varieties**
  - Larger scale only part of the challenge
  - Issues like growing windows necessitate further investment

Getting to 20/20 - Hops

- 25% increase in hop volume
- Greater increase in acreage/resources
  - 30% increase in acres
  - Acreage needed greater than hop increase
    - Aroma vs Alpha
    - Starting to run out of acres to switch
    - More resource intensive
  - $10K an acre + processing ($5K)
    - Capacity is fine – but harvest windows tightening
    - "New" acres cost more

Getting to 20/20 - Hops

- 12,000 new acres?
- $180 million *minimum* in acreage investments?
- Growers get it, but more work
- 25 million more pounds of hops
  - Pelletizing infrastructure
  - Storage (even 25 cents a pound adds up)
  - New technologies/products
    - Hop Hunter anyone?

Getting to 20/20 - Hops

- Other investments may double cost
  - Collective half a billion $'s not out of the picture
- Will new areas help?
- Yes, but at the margins
  - Lack of scale
  - Higher cost
  - Uncertain demand
  - More fragmented

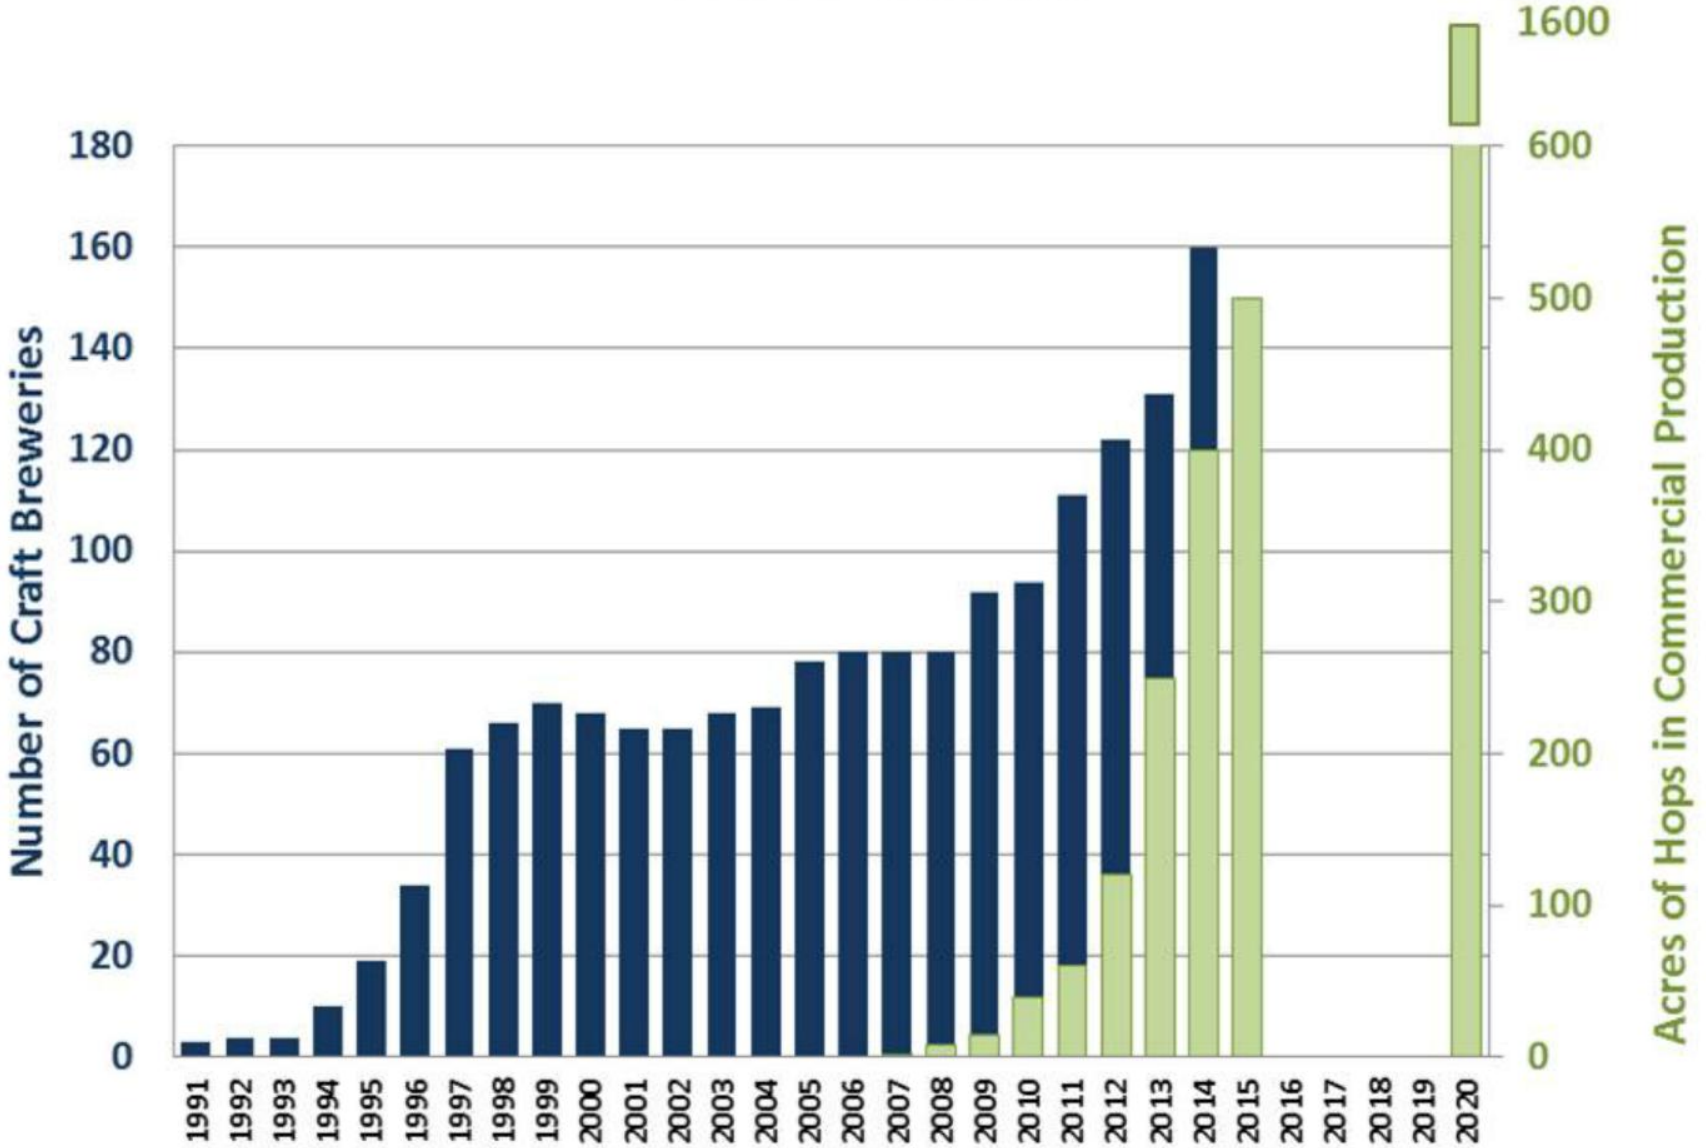
2013 Beer Sold in MI (bbls)

All Beer 6,257,864 bbls

All Craft Beer 452,000, 7.2%

MI Craft Beer 297,000, 4.7%

Growth in Michigan's Craft Beer and Hop Supply Chain Sectors



TAKE HOME MESSAGES

-Quality is crucial, brewers want pellets

-Do not skimp on establishment

-Post-harvest very important

-Hi initial and annual costs

-Don’t underestimate the amount of labor required

-Need for picking and processing equipment if you plant >1/3 acre

-Line up supplies well in advance

-How will you sell your hops and to whom?

-You will need a price premium to do organic
